

¹³C NMR Study of Derivatives of Dibenzobarrelene, Anthraquinone and Anthracene

Ralf Sieckmann

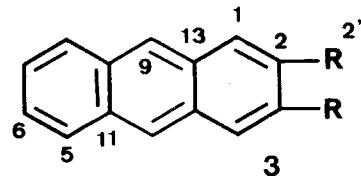

Ungererstr. 19, D-8000 München 40, Germany

Carbon-13 chemical shifts of 22 derivatives of dibenzobarrelene, anthraquinone and anthracene are reported, each of which includes a symmetrical *ortho*-benzene moiety. The assignment of the chemical shifts of the aromatic carbons of these derivatives was achieved by correlation with the corresponding ¹³C chemical shifts of *ortho*-disubstituted benzenes.

KEY WORDS ¹³C NMR 2,3-Di-X'-11,12-carbomethoxydibenzobarrelenes 2,3-Di-X'-9,10-anthraquinones
2,3-Di-X'-anthracenes

INTRODUCTION

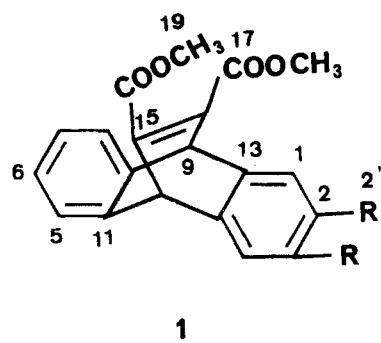

Although there have been several ¹³C NMR investigations dealing with the recording and assignment of *para* and *meta*-disubstituted benzene derivatives having two like or two different substituents,¹ there has hitherto, to my knowledge, been no systematic report on symmetrically disubstituted benzene derivatives. The ¹³C NMR spectra of symmetrically substituted *ortho*-disubstituted aromatic compounds are only sporadically found in the literature within the series of 1,2-di-X'-benzenes² and 2,3-di-X'-naphthalenes.³ This work provides, for the first time, ¹³C NMR chemical shift data for several classes of compounds, namely 2,3-di-X'-carbomethoxydibenzobarrelenes (1), 2,3-di-X'-9,10-anthraquinones (2) and 2,3-di-X'-anthracenes (3).

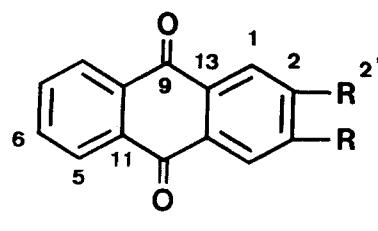

RESULTS AND DISCUSSION

The chemical shifts of the 2,3-di-X'-dicarbomethoxydibenzobarrelenes (1) are presented in Table 1. The chemical shifts of the 2,3-di-X'-9,10-anthraquinones (2) are presented in Table 2 together with those of the parent compound anthraquinone, the chemical shifts of which have already been published.⁴ The chemical shifts of the 2,3-di-X'-anthracenes (3) are given in Table 3 together with those of the parent compound anthracene, the chemical shifts of which have already been published.⁵

The assignment of the chemical shifts of the aromatic carbons of the substituted moiety of the compounds mentioned above, and presented in Tables 1-3, was achieved by correlation with the corresponding chemical shifts of the 1,2-di-X'-benzenes. [For correlation the ¹³C chemical shifts in Ref. 2 (I-VII), supplemented by the measured data of the ultimate paragraph of the present Experimental section, are first normalized to CDCl₃, δ = 77.00 (TMS). The correlation coefficient for the compounds 1 always exceeded 0.98, and for compounds 2 and 3 they exceeded 0.94.] The ¹³C NMR chemical shifts of 1,2-di-X'-benzenes, which have not been published earlier, i.e. for X' = CN, CHO and OCOCH₃, are presented under Experimental.

X'-9,10-anthraquinones (2) and the 2,3-di-X'-anthracenes (3) were prepared by generally known methods.^{6,7}

Phthalonitrile and phthaldehyde were purchased from Aldrich Chemical and 1,2-diacetyloxybenzene was prepared by pyridine-catalysed condensation of catechol and acetic anhydride.

The ¹³C NMR spectra were recorded on (A) Bruker

WH 90 (22.64 MHz), (B) Bruker WH 250 (62.90 MHz) and (C) Bruker WM 400 (100.61 MHz) spectrometers. The pulse width was 6 μ s for A, 8 μ s for B and 4 μ s for C and FIDs were collected in 8K data points for A, 16K for B and 16K for C with a sweep width of 1000 Hz for A, 15.625 kHz for B and 25.000 kHz for C. The flip angles were 30°, 30° and 50°, respectively. The number

of scans ranged from 250 to 20 000, depending on solubility. The samples were recorded in CDCl_3 at ambient temperature applying internal deuterium lock, and are referenced to the central peak ($\delta = 77.00$) corresponding to $\delta = 0.00$ for TMS; the chemical shifts are accurate to at least 0.05 ppm. ^{13}C NMR of 1,2-di-X'-benzenes: 1,2-dicyanobenzene, 115.30 C-1, 133.20 C-3, 133.50 C-4, 115.88 ppm CN; 1,2-diformylbenzene, 136.38 C-1, 133.73 C-3, 131.08 C-4, 192.33 ppm CHO; 1,2-

diacetyloxybenzene, 141.90 C-1, 123.10 C-3, 126.10 C-4, 167.60 CO, 20.10 ppm CH_3 .
