### ABSTRACT

The reaction of 2-substituted-4H-pyrido[2,3-h]benzoxazin-4ones (1) with hydrazine hydrate resulted in 2-substituted-3aminopyrido[2,3-h]quinazolin-4(3H)ones (2) and not in the corresponding 3. The Schiff bases (4) of 2 on pyrolysis led to 2-substituted pyrido[2,3-h]quinazolin-4(3H)ones (5).

The potentiality of 5-aminoquinoline-6-carboxylic acid<sup>[1]</sup> has not been explored fully. It has been used by us earlier in the synthesis of 2,3-disubstituted pyrido[2,3-h]benzoxazin-4-ones.<sup>[2]</sup> The results of 2-substituted-4H-benzoxazin-4-one and hydrazine hydrate<sup>[3-7]</sup> have been debated earlier. This prompted us to take up the investigation of 2-substituted-4Hpyrido[2,3-h]benzoxazin-4-one and hydrazine hydrate reaction and the results with spectral, analytical and chemical evidence are presented hereunder (Tables 1 and 2).

Table 1. Characterisation Data of 2, 4, and 5

The reaction of 2-*p*-tolyl-4H-pyrido[2,3-h]benzoxazin-4-one (1, Ar = 4-CH<sub>3</sub>-C<sub>6</sub>H<sub>4</sub>) with an excess of hydrazine hydrate under refluxing condition for 2 h gave a crystalline compound with m.p. 258°C. The mass spectrum of the compound revealed the molecular ion at m/z 302. The <sup>1</sup>H-NMR spectrum (DMSO-d<sub>6</sub>) exhibited signals at  $\delta$  2.4 (s, 3H, CH<sub>3</sub>), 5.9 (s, 2H, NH<sub>2</sub>, D<sub>2</sub>O exchangeable), 7.3 (d, 2H, Ar–H, H<sup>7</sup>, H<sup>8</sup>), 7.7 (m, 1H, Ar–H, H<sup>4</sup>), 7.9 (m, 3H, Ar–H, H<sup>2</sup>, H<sup>6</sup>, H<sup>9</sup>), 8.1 (d, 1H, Ar–H, H<sup>5</sup>), 9.1 (d, 1H, Ar–H, H<sup>1</sup>), 9.3 (d, 1H, Ar–H, H<sup>3</sup>). Based on the elemental analysis and spectral data the

Table 2. Analytical Data of 2, 4, and 5

compound was assigned the structure 2-*p*-tolyl-3-aminopyrido[2,3-h]quinazolin-4(3H)one (2b). An alternate pyridobenzotriazepin-5-one structure (3, Ar = 4-CH<sub>3</sub>-C<sub>6</sub>H<sub>4</sub>) for this compound is ruled out based on the presence of a doublet around 3250 cm<sup>-1</sup> corresponding to NH<sub>2</sub> in its IR spectrum (KBr) and also a two proton D<sub>2</sub>O exchangeable singlet at  $\delta$  5.9 in its <sup>1</sup>H-NMR spectrum.

The reaction has been extended to other 2-aryl-4H-pyrido[2,3-h]benzoxazin-4-ones (1) and in each case the product was identified as the

Scheme 1.

corresponding 2-aryl-3-aminopyrido[2,3-h]quinazolin-4(3H)-one (2) based on spectral and analytical data (Scheme 1).

The formation of 2 from 1 probably involves nucleophilic attack by hydrazino nitrogen on carbonyl carbon of the latter, resulting in an open chain intermediate.<sup>[6,8]</sup> Subsequent loss of elements of water from the tautomeric form of the intermediate involving NH and not NH<sub>2</sub> yields compound 2. Compounds 2 were also obtained from 1 and hydrazine hydrate under variety of conditions like hot acetic acid, refluxing methanol, xylene and pyridine.

Further proof for the structure assigned to compound 2 came from the fact that it formed a Schiff base (4) with aromatic aldehyde. Compound 4 was characterised by the presence of an azomethine signal in its <sup>1</sup>H-NMR spectrum (DMSO–d<sub>6</sub>, Table 3) and characteristic ( $M^+$ –H) peak in its mass spectrum. To ascertain the generality, all the 2 were treated independently with benzaldehyde, 4-methylbenzaldehyde and 4-methoxybenzaldehyde. In each case the corresponding 4 were characterised by spectral and analytical data.

The *N*–*N* bond is considered to be labile and susceptible to cleavage. To verify this, 2-*p*-tolyl-3-benzylidene aminopyrido[2,3-h]quinazolin-4(3H)-one (4d) was subjected to neat pyrolysis above its melting point. The reaction mixture on processing afforded the benzonitrile and a compound with molecular ion at m/z 287. The IR spectrum (KBr) showed the presence of NH (broad at 3200 cm<sup>-1</sup>), amide C=O (at 1658 cm<sup>-1</sup>) and C=N

5c	3.8 (s, 3H, OCH <sub>3</sub> ), 7.1 (s, 1H, NH, D <sub>2</sub> O exchangeable), 7.2 (d, 2H, Ar–H, H <sup>7</sup> , H <sup>8</sup> ), 7.7 (m, 1H, Ar–H, H <sup>4</sup> ), 7.8 (m, 3H, Ar–H, H <sup>2</sup> , H <sup>6</sup> , H <sup>9</sup> ), 8.2 (d, 1H, Ar–H, H <sup>5</sup> ), 9.1 (d, 1H, Ar–H, H <sup>1</sup> ), 9.3 (d, 1H, Ar–H, H <sup>3</sup> ).	

(at 1599 cm<sup>-1</sup>). The <sup>1</sup>H-NMR spectrum (DMSO–d<sub>6</sub>) exhibited signals at  $\delta$  2.4 (s, 3H, CH<sub>3</sub>), 7.2 (s, 1H, NH, D<sub>2</sub>O exchangeable), 7.5 (d, 2H, Ar–H, H<sup>7</sup>, H<sup>8</sup>), 8.2 (m, 3H, Ar–H, H<sup>2</sup>, H<sup>6</sup>, H<sup>9</sup>), 8.4 (d, 1H, Ar–H, H<sup>4</sup>), 8.7 (d, 1H, Ar–H, H<sup>5</sup>) and 9.4 (m, 2H, Ar–H, H<sup>1</sup>, H<sup>3</sup>). Based on the spectral and analytical data the compound has been characterised as 2-*p*-tolyl-pyrido[2,3-h]quinazolin-4(3H)-one (5b). Similarly all the 4 on pyrolysis afforded the corresponding arylnitrile and 5.

Formation of 5 and arylnitrile from 4 probably involves a sixmembered cyclic transition state involving H-transfer and the N-N bond cleavage. Compounds 5 were also obtained from 2 in the presence of MA.

# ARUNA KUMARI AND JAYAPRASAD RAO

KMnO<sub>4</sub> and dry acetone under refluxing conditions. In this reaction, the compound 2 undergoes oxidative coupling to give dipyridoquinazolinyl hydrazine<sup>[9]</sup> followed by the loss of nitrogen through a six-membered cyclic transition state to yield 5. Reaction of 1 with an excess of ammonia under refluxing conditions also afforded 5.

## **EXPERIMENTAL SECTION**

**2-Substituted-3-aminopyrido**[**2,3-h**]**quinazolin-4(3H)ones (2):** A mixture of 2-substituted-4H-pyrido[2,3-h]benzoxazin-4-one (1, 10 mmol) and hydrazine hydrate (99%, 5 mL) was heated under reflux for 2 h, cooled and diluted with water. The compound (2) that separated was filtered, washed with a few drops of alcohol and dried.

2-Substituted-3-arylidene aminopyrido[2,3-h]quinazolin-4(3H)-ones (4):

A mixture of 2 (1 mmol) and aromatic aldehyde (1 mmol) in ethanol (5 mL) was warmed on steam bath for 15 min and cooled to give crystalline 4.

**2-Substituted pyrido**[2,3-h]quinazolin-4(3H)-ones (5): 1 mmol of 4 was heated 20°C above its melting point for 1 h. Later it was dissolved in chloroform and subjected to chromatography. Elution with benzene–ethylacetate (1:1) mixture yielded pure 5.

Oxidation of 2-substituted-3-aminopyrido[2,3-h]quinazolin-4(3H)ones (2) to give 5.

Compounds 2 were oxidised by KMnO<sub>4</sub> following a similar oxidation reaction reported in literature.<sup>[9]</sup>
