(Received October 1, 2002; accepted November 19, 2002)

5-(7-Hydroxyheptyl)-1,2-dithiolan-3-one 1-oxide was designed and synthesized in our laboratories that contain the heterocycle of 1,2dithiolan-3-one 1-oxide, a reactive core of antibiotic leinamycin. In addition, the activated ester of 5-(7-hydroxyheptyl)-1,2-dithiolan-3-one 1oxide was prepared, which presumably is useful for coupling this DNAcleaving functionality to certain DNA-binding agents.

Keywords: Antibiotic; antitumor agents; heterocycle; leinamycin

Since the discovery of structural elucidation<sup>1</sup> and total synthesis<sup>2</sup> of the antibiotic leinamycin in 1990s, it has been demonstrated that this antibiotic exhibited potent activity against murine experimental tumor leukemia P388 and saccoma 180 as well as against Grampositive bacteria.<sup>3</sup> Subsequent examination indicated that the latent DNA-cleaving activity of leinamycin is accountable for its cytotoxic properties.<sup>4,5</sup> Unlike any previously discovered natural products in molecular structure, on the other hand, leinamycin possesses the unique 1,2-dithiolan-3-one 1-oxide heterocycle as its reactive core.<sup>6</sup> In addition, certain mechanistic investigations revealed that the heterocycle of 1,2-dithiolan-3-one 1-oxide plays a crucial role in the thiol-activated DNA-cleaving processes in which free radicals are involved.<sup>4-6</sup> With the intention of further exploring the chemical and

biological properties of leinamycin, we recently have designed and synthesized 5-(7-hydroxyheptyl)-1,2-dithiolan-3-one 1-oxide **1** in our laboratories that contains the heterocycle of 1,2-dithiolan-3-one 1-oxide in its structure, the reactive core of leinamycin.<sup>6</sup> In addition, the activated ester of 5-(7-hydroxyheptyl)-1,2-dithiolan-3-one 1-oxide **2** was prepared which presumably is useful for coupling this DNA-cleaving functionality to certain DNA-binding agents.<sup>7,8</sup> The synthesis of 5-(7-hydroxyheptyl)-1,2-dithiolan-3-one 1-oxide **1** as well as **2** is discussed in this article.

# **RESULTS AND DISCUSSION**

Scheme 1 depicts our synthetic route toward 5-(7-hydroxyheptyl)-1,2-dithiolan-3-one 1-oxide starting with a monosilylation reaction of octane-1,8-diol by using stoichiometric equivalent sodium hydride as base. The aldehyde 5 was obtained through an oxidation reaction of the alcohol 4 with PDC.<sup>9</sup> Olefination of 5 was carried out via an Horner-Emmons type reaction involving phosphonate anions.<sup>10</sup> Hydrolysis of **6** posed a challenge in our synthesis because this ester is exceptionally stable toward many commonly used hydrolytic reagents such as sodium hydroxide and potassium hydroxide/aqueous-ethanol. After several attempts, our hydrolysis of  $\mathbf{6}$  was accomplished successfully by stirring this ester in KOtBu/tBuOH. The yield of this reaction in our studies can even be optimized to 87% when LiOH/EtOH is used. Benzyl thioether 8 was obtained through a reaction of prop-2-enoic acid **7** with toluene- $\alpha$ thiol in piperidine.<sup>11</sup> Since the mercapto acid **9** is too unstable to survive in many purification processes, Li/liquid ammonia<sup>12</sup> was employed to carry out this debenzylation reaction. Cyclization reaction of 9 in the solution of isobutyl chloroformate and triethylamine gave rise to the corresponding thiolactone 10. The ring-opening reaction of thiolactone 10 afforded the corresponding mercapto thioic acid 11, a process catalyzed by hydrogen sulfide.<sup>11</sup> Oxidative reaction of **11** with sodium iodate supported on neutral alumina in biphases circumstance and gave rise to the ring-closure product 12.<sup>13</sup> Desilylation of 12 in hydrochloric acid/ethanol was used to produce the corresponding alcohol 13. Finally, mCPBA was applied to accomplish the S-oxidation of 1,2-dithiolan-3one moiety to afford the 1.2-dithiolan-3-one 1-oxide 1a and 1b, a pair of diastereomers separable through flash column chromatography.

In order to covalently linking the core functionality of leinamycin to certain DNA-binding agents for the future use, the activated ester 2 also was synthesized.<sup>7,8</sup> The linker **15** was prepared first through the

# EXPERIMENTAL

All <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were obtained on a Bruker Advance DPX 400 FT-NMR Spectrometer or Varian Unity INOVA 500 FT-NMR Spectrometer. Low resolution mass spectra were obtained on Fisons VG Platform Mass Spectrometer, or Hewelett Packard G1800C GCD Series II GCMS. High resolution mass spectra (HRMS) were measured by Finnigan MAT95 Mass Spectrometer. All reactions were monitored by thin layer chromatography (TLC) performed on Merck precoated silica gel 60  $F_{254}$  plates. Flash column chromatography was carried out on columns of NA or Merck Keisel silica gel 60 (230–400 mesh).

60% w/w sodium hydride (9.0 g, 0.226 mmol) was suspended in distilled THF (400 mL) followed by the addition of octane-1,8-diol **3** (29.70 g, 0.204 mmol) in THF (150 mL). The mixture was stirred at room temperature for 2 h at which time a large amount of opaque white precipitates were formed. After the addition of *tert*-butyldimethylsilyl chloride (34.0 g, 0.226 mmol) in THF (50 mL), the mixture was stirred vigorously at room temperature overnight. The reaction was quenched by the addition of ca 300 mL of saturated aqueous K<sub>2</sub>CO<sub>3</sub> and extracted with diethyl ether (2 × 250 mL). The combined organic extracts were washed with brine (150 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo to afford **4** (35.60 g, 67%) as colorless syrup: <sup>1</sup>H NMR  $\delta$  (CDCl<sub>3</sub>) 0.04 (s, 6H), 0.89 (s, 9H), 1.34 (m, 6H), 1.54 (m, 6H), 3.59 (t, 2H, *J* = 6.5 Hz), 3.64 (t, 2H, *J* = 6.5 Hz); <sup>13</sup>C NMR  $\delta$  (CDCl<sub>3</sub>) –5.27, 18.37, 25.63, 25.66, 25.72, 25.97, 29.38, 32.76, 32.83, 63.06, 63.29; ESIMS m/z (%) 261 [(M + 1)<sup>+</sup>, 8], 257 (12), 169 (6), 147 (100).

A flask was equipped with a stirrer, calcium chloride drying tube, nitrogen inlet, dry ice condenser, and ammonia inlet. After the flask was flushed thoroughly with a stream of nitrogen, the ammonia was passed through and condensed into the flask followed by the addition of 8 (6.80 g, 16.0 mmol) in distilled THF (50 mL) at  $-78^{\circ}$ C. Finely divided metal lithium was added to allow the deep blue color of the solution to persist. The mixture was stirred at -60 to  $-78^{\circ}$ C for 1.5 h followed by the addition of adequate amount of solid  $NH_4Cl$  to quench the reaction. After passing  $N_2$  through the white slurry mixture to remove the remaining ammonia at room temperature, the solid residue was dissolved in water (50 mL) which was acidified with 15% v/v aqueous HCl to allow its pH to reach 2-3. The aqueous mixture was extracted with  $CH_2Cl_2$  $(3 \times 100 \text{ mL})$ . The combined organics was washed with water (30 mL), brine  $(3 \times 25 \text{ mL})$ , and dried over Na<sub>2</sub>SO<sub>4</sub>. To a solution of **11** (2.33 g, 6.58 mmol) in the mixture of hexane:  $CHCl_3$  (24 mL: 2 mL) was added  $NaIO_3/Al_2O_3$ - $NaIO_3$  (14.2 g). The mixture

was stirred at room temperature for 40 min followed by filtration. The filter-cake was washed with appropriate volume of CH<sub>2</sub>Cl<sub>2</sub>. The filtrate was concentrated in vacuo. The resultant residue was purified by flash column chromatography with hexane: EtOAc (15:1, v/v) as eluent to afford **12** (2.01 g, 87%) as a slightly yellow oil: <sup>1</sup>H NMR  $\delta$  (CDCl<sub>3</sub>) 0.04 (s, 6H), 0.89 (s, 9H), 1.32 (bs, 6H), 1.49 (m, 4H), 1.78 (m, 2H), 2.67 (dd, 1H, J = 16.0, 8.5 Hz), 3.00 (dd, 1H, J = 16.5, 5.5 Hz), 3.60 (t, 2H, J = 7.0 Hz), 3.70 (m, 1H); <sup>13</sup>C NMR  $\delta$  (CDCl<sub>3</sub>) –5.29, 18.34, 25.65, 25.95, 27.77, 29.12, 32.73, 32.86, 49.20, 49.25, 63.15, 206.47; ESIMS m/z (%) 349 [(M + 1)<sup>+</sup>, 19], 317 (33), 301 (7), 256 (11), 236 (11), 235 (100), 217 (22); HRESIMS found 348.1588, calculated for C<sub>16</sub>H<sub>32</sub>O<sub>2</sub>S<sub>2</sub>Si 348.1605.

## 5-(7-Hydroxyheptyl)-1,2-dithiolan-3-one (13)

To a solution of **12** (1.462 g, 4.201 mmol) in EtOH (20 mL) was added a queous HCl (15%, 0.9 mL). The mixture was stirred at room temperature for 40 min followed by the addition of Et<sub>3</sub>N (0.5 mL). The organic phase was concentrated in vacuo. The residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (30 mL), washed with water (20 mL), brine (20 mL), and dried over Na<sub>2</sub>SO<sub>4</sub>. After evaporation under vacuum, the crude product was purified by flash column chromatography with hexane: EtOAc (5:1, v/v) to yield **13** (0.906 g, 92%) as a yellow syrup: <sup>1</sup>H NMR  $\delta$  (C<sub>6</sub>D<sub>6</sub>) 0.92 (m, 3H), 1.01 (m, 4H), 1.18 (m, 3H), 1.35 (quintet, 2H, *J* = 7.5 Hz), 1.97 (dd, 2H, *J* = 16.5, 8.5 Hz), 2.25 (dd, 1H, *J* = 16.5, 5.5 Hz), 2.83 (m, 1H), 3.35 (t, 2H, *J* = 7.0 Hz); <sup>13</sup>C NMR  $\delta$  (C<sub>6</sub>D<sub>6</sub>) 25.98, 27.83, 29.29, 29.40, 32.72, 33.01, 48.80, 49.02, 62.56, 205.44; ESIMS m/z (%) 234. ## 5-(7-Hydroxyheptyl)-1,2-dithiolan-3-one 1-Oxide (1)

To a solution of **13** (0.521 g, 2.22 mmol) in distilled CH<sub>2</sub>Cl<sub>2</sub> (15 mL) was added a solution of 70–75% *m*CPBA (1.410 g, 5.55 mmol) in distilled CH<sub>2</sub>Cl<sub>2</sub> (10 mL). The mixture was stirred at -40 to  $-50^{\circ}$ C for 30 min. After warming up the mixture to  $0^{\circ}$ C, saturated sodium sulfite solution was added followed by the extraction of the aqueous suspension with CH<sub>2</sub>Cl<sub>2</sub> (3 × 20 mL). The combined organic extracts were washed with saturated sodium sulfite aqueous solution (20 mL), water (20 mL), brine (20 mL), and dried over Na<sub>2</sub>SO<sub>4</sub>. After evaporation under vacuum, the crude product was purified by flash column chromatography with hexane: EtOAc (5:1  $\rightarrow$  1:2, v/v) as eluent to afford two diastereomers **1a** and **1b**, **1a** (0.220 g, 39%, a colorless oil): <sup>1</sup>H NMR  $\delta$  (C<sub>6</sub>D<sub>6</sub>) 0.827 (m, 1H), 1.01 (m, 2H), 1.11 (m, 4H), 1.21 (quintet, 2H, J = 7.0 Hz), 1.43 (m, 3H), 2.18 (dd, 1H, J = 20.0, 5.0 Hz), 2.24 (m, 1H), 2.72 (dd, 1H, J = 16.5,

## Hexanedioic Acid Mono-(2,5-dioxopyrrolidin-1-yl)Ester (15)

To a solution of adipic acid 14 (5.02 g, 34.1 mmol) and Nhydroxysuccinimide (4.05 g, 40.9 mmol) in distilled THF (60 mL) was added N,N'-dicyclohexylcarbodiimide (7.22 g, 34.9 mmol) in distilled THF (20 mL) at  $0^{\circ}$ C. The mixture was stirred at the same temperature for 15 min followed by the addition of a catalytic amount of DMAP  $(\sim 30 \text{ mg})$  in one portion. The mixture was stirred overnight at which time it was allowed to warm up to room temperature. After filtration of the resultant DHU, the filtrate was concentrated by rotavaporation. The residue was redissolved in  $CH_2Cl_2$  (50 mL), washed with water  $(2 \times 20 \text{ mL})$ , brine (20 mL) and dried over Na<sub>2</sub>SO<sub>4</sub>. After evaporation under vacuum, the residue was purified by flash column chromatography with hexane: EtOAc:  $CH_2Cl_2$  (10:10:1, v/v/v) as eluent to afford 15 (3.83 g, 49%) as a white crystal: <sup>1</sup>H NMR  $\delta$  (CDCl<sub>3</sub>) 1.79 (m, 4H), 2.42 (t, 2H, J = 7.0 Hz), 2.65 (t, 2H, J = 7.0 Hz), 2.84 (bd, 4H, J = 4.5 Hz),<sup>13</sup>C NMR  $\delta$  (CDCl<sub>3</sub>) 23.88, 24.09, 25.80, 30.81, 33.58, 168.50, 169.53, 179.23; ESIMS m/z (%) 244 [(M + 1)<sup>+</sup>, 38], 226 (11), 225 (100), 111 (9), 91 (14); HRESIMS found 243.1318, calculated for  $C_{10}H_{13}NO_6$  243.1294.

# Hexanedioic Acid 2,5-dioxo-pyrrolidin-1-yl Ester 7-heptyl-[5-(1,2-dithiolan-3-one)] Ester (16)

To a solution of **15** (0.301 g, 1.239 mmol) and **13** (0.264 g, 1.130 mmol) in distilled CH<sub>2</sub>Cl<sub>2</sub> (6 mL) was added *N*,*N'*-dicyclohexylcarbodiimide (0.260 g, 1.241 mmol) in distilled CH<sub>2</sub>Cl<sub>2</sub> (2 mL) at 0°C. The mixture was stirred at the same temperature for 10 min followed by the addition of a catalytic amount of DMAP (~15 mg). After 3 h at room temperature, the resultant DHU was filtered off. The filter-cake was washed with CH<sub>2</sub>Cl<sub>2</sub>. The filtrate was concentrated in vacuo. The residue was purified by flash column chromatography with hexane: EtOAc (5:1, v/v)
