Abstract: A novel and efficient palladium-catalyzed cascade annulation/arylthiolation reaction has been developed to afford functionalized 3-sulfenylbenzofuran and 3-sulfenylindole derivatives in moderate to good yields from readily available 2-alkynylphenols and 2-alkynylamines in ionic liquids. This protocol provides a valuable synthetic tool for the assembly of a wide range of 3-sulfenylbenzofuran and 3-sulfenylindole derivatives with high atom- and step-economy and exceptional functional group tolerance. Moreover, the employment of ionic liquids under mild reaction conditions makes this transformation green and practical. Furthermore, this approach enriched current C–S bond formation chemistry, making a valuable and

practical method in synthetic and medicinal chemistry.

INTRODUCTION

The development of general and efficient methods for assembly of new chemical bonds is fundamental and vibrant fields in both academic and industrial process.¹ Prominently, transition metal-catalyzed transformations have emerged as a powerful tool for the efficient construction of carbon-heteroatom bonds and, hence, have become the most attractive and versatile methods in contemporary organic synthesis.² In this regard, as one of the most important carbon-heteroatom bonds in organic chemistry, C-S bonds are frequently found in many important pharmaceuticals and biologically active natural compounds.³ In recent years, many representative methods have been developed for constructing C-S bonds. Generically, three strategies are typically employed: (i) coupling of vinyl/aryl halides with sulfenylating sources, such as thiols, sulforyl chlorides, disulfides and other activated sulfurating reagents;⁴ (ii) coupling of alkyl- and aryllithium or Grignard reagents with diphenyldisulfides, thiosulfonates and sulfur;⁵ (iii) direct arylthiolation of C-H bonds with sulfurating reagents.⁶ Despite the significances, all these elegant developments suffer from certain limitations such as prefunctionalized reactants, stringent reaction conditions or toxic and unstable sulfur sources, which lower the synthetic efficiency and generality. As a consequence, the development of efficient and atom economical synthetic methods for the rapid and straightforward construction of C-S bonds is still highly desirable.

In addition, among the family of benzofurans, 2,3-difunctionalized benzofurans

are attractive synthetic targets because of their remarkable biological activities and potentiality of being pharmaceutical,⁷ prompting development of many efficient synthetic methods for constructing this scaffold.⁸ However, the straightforward synthesis of 2-substituted 3-sulfenylbenzofurans from readily accessible starting materials has been scarcely explored. Recent achievements for the construction of 3-sulfenylbenzofuran scaffold mainly include: (i) electrophilic cyclization of 2-alkynylphenol derivatives with sulfurating reagents (Scheme 1a);⁹ (ii) metal-involved cascade annulation of 2-alkynylphenol derivatives with disulfides (Scheme 1b);¹⁰ (iii) I₂-mediated cyclization of 2-alkynylanisoles with sulfurating reagents (Scheme 1c).¹¹ Nevertheless, these approaches require foulsmelling, toxic and unstable sulfur sources as starting materials. From the view point of synthetic simplicity as well as new practical and environmentally benign process, the synthesis of 3-sulfenylbenzofurans via a transition metal-catalyzed cascade annulation reaction would be an ideal strategy. More recently, we report an efficient and ecofriendly method for the construction of 2,3-difunctionalized benzofuran derivatives in moderate to good yields from readily available 2-alkynylphenols in ionic liquids.¹² Inspired by the aforementioned background and our longstanding interest in Pd-catalyzed cross-coupling reactions in ionic liquids,¹³ herein, we disclose an efficient and concise route for the synthesis of 3-sulfenylbenzofurans and 3-sulfenylindoles via nucleopalladation triggering intermolecular cascade reaction in ionic liquids (Scheme 1d).

RESULTS AND DISCUSSION

To begin our investigation, 2-(phenylethynyl)phenol (**1a**), phenylboronic acid (**2a**) and elemental sulfur (S₈) were selected as a model system to screen the optimal conditions, and the results are summarized in Table 1. First, with the combination of Pd(OAc)₂ (5 mol %), CuI (1 equiv), Phen (1.1 equiv), BQ (2 equiv) and K₂CO₃ (2 equiv) in [Bmim]Cl (1 mL)¹⁴ at 80 °C for 8 h, the desired sulfenylation product **3aa** was obtained in 27% GC yield (Table 1, entry 1). Further exploration of oxidants in the model reaction indicated that Ag₂CO₃ was superior to others (entries 1-4). Among the examination of palladium catalysts, other palladium catalysts, including Pd(OAc)₂, PdI₂, PdCl₂, Pd(PhCN)₂Cl₂ and [Pd(y^3 -C₃H₅)Cl]₂, were inferior to Pd(TFA)₂ (entries 4-9). Subsequently, different copper salts were examined, including CuCl, CuBr, CuCN and CuI, and CuI was the most effective catalyst for this transformation (entry

5). Except for K_3PO_4 , other bases, including K_2CO_3 , KF, Cs_2CO_3 , Et₃N and CsF, showed low efficiencies (entries 5, 14-18). Finally, the reaction without the use of a metal salt was found to be ineffective (entries 20 and 21).

Table 1. Optimization of the reaction conditions^{*a*}

^{*a*} Reactions were performed with **1a** (0.10 mmol), **2a** (0.15 mmol), **S**₈ (0.30 mmol), catalyst (5 mol %), CuX (0.20 mmol), Phen (1,10-phenanthroline, 0.22 mmol), oxidant (0.2 mmol), base (0.2 mmol), [Bmim]Cl (1-butyl-3-methylimidazolium chloride, 1 mL) at 80 °C for 8 h. BQ = 1,4-benzoquinone; ^{*b*} Determined by GC using dodecane as the internal standard; The value in parentheses is the yield of isolated product; ^{*c*} At 100 °C.

Scheme 2. Cascade annulation/arylthiolation of **2a** with various 2-alkynylphenols^a

^{*a*} Reaction conditions: **1** (0.20 mmol), **2a** (0.4 mmol), S_8 (0.60 mmol), Pd(TFA)₂ (5 mol %), CuI (0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol), K₃PO₄ (0.4 mmol), [Bmim]Cl (1 mL) at 80 °C for 8 h; Yields referred to isolated yield.

After establishing the optimized reaction conditions, the generality and substrate scope of 2-alkynylphenol derivatives were investigated (Scheme 2). Gratifyingly, both electron-donating and electron-withdrawing substituents on the phenyl ring afforded the desired products in good yields (**3aa-3am**). Additionally, this transformation could be successfully extended to 2,4- and 3,4-disubstituted 2-alkynylphenols, furnishing the corresponding 3-sulfenylbenzofuran derivatives **3aj** and **3ak** in 83% and 73% yields, respectively. More bulky substrates such as 2-((4'-propyl-[1,1'-biphenyl]-4-yl)ethynyl)phenol (11)and 2-((4-(4-ethylcyclohexyl)phenyl)ethynyl)phenol (1m) also efficiently reacted with 2a and gave the products **3al** and **3am** in 78% and 75% yields, respectively. Importantly,

impressive feature of the current cascade annulation/arylthiolation reaction is its high tolerance for functional groups. For instance, the 2-alkynylphenols containing thienyl group underwent the cascade reaction to give the corresponding product **3an** in 68% yield. Notably, 2-alkynylphenols **1** with alkyl groups attached on the triple bond proceeded smoothly to give the products **3** in moderate to good yields (**3ao-3ar**). Delightfully, various substituted 2-alkynylphenols with electron-donating groups (Me) and weakly or moderately electron-withdrawing groups (F, Cl, Br, COOMe, NO₂) afforded the corresponding 3-sulfenylbenzofuran derivatives **3as-3ax** in moderate to excellent yields.

Scheme 3. Cascade annulation/arylthiolation of 1a with various arylboronic acid derivatives^a

^{*a*} Reaction conditions: **1a** (0.20 mmol), **2** (0.4 mmol), S₈ (0.60 mmol), Pd(TFA)₂ (5 mol%), CuI (0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol), K₃PO₄ (0.4 mmol), [Bmim]Cl (1 mL) at 80 $^{\circ}$ C for 8 h; Yields referred to isolated yield.

Subsequently, to further demonstrate the synthetic potential of this method, various arylboronic acid derivatives were introduced to this cascade reaction (Scheme 3). Various substituents of arylboronic acid, such as methyl, methoxyl, halo, and nitro groups were tolerated well, allowing the generation of a range of 3-sulfenylbenzofurans derivatives in moderate yields (**3ba-3bh**).

Scheme 4. Substrate scope of 2-alkynyl arylamines^a

^{*a*} Reaction conditions: **4** (0.20 mmol), **2a** (0.4 mmol), S₈ (0.60 mmol), Pd(TFA)₂ (5 mol %), CuI (0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol), K₃PO₄ (0.4 mmol), [Bmim]Cl (1 mL) at 80 $^{\circ}$ C for 8 h; Yields referred to isolated yield.

As mentioned previously, 3-sulfenylindoles could be synthesized by 2-alkynylanilines with disulfides.¹⁵ Gratifyingly, 3-sulfenylindoles also could be constructed *via* the cascade annulation/arylthiolation of 2-(phenylethynyl)aniline

derivatives with phenylboronic acid 2a. As illustrated in Scheme 4, anilines with electron-rich substituents (Me, OMe) or electron-poor substituents (F, Cl, Br, CF₃, COOMe) all gave the desired products in satisfactory yields (5aa-5ak). Moreover, substitution position of the aromatic ring just had a slight impact (5ab, 5ac and 5ae). These results showed that this new transformation was tolerant towards the electronic effects of and steric the aromatic ring. However, when 3-(phenylethynyl)pyridin-2-amine (41) was subjected to the standard reaction conditions, only trace amount of the desired product 5al was detected by GC-MS.

Scheme 5. Substrate scope of 2-alkynyl arylamines^{*a*}

^a Reaction conditions: 4 (0.20 mmol), 2a (0.4 mmol), S₈ (0.60 mmol), Pd(TFA)₂ (5 mol %), CuI

(0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol), K₃PO₄ (0.4 mmol), [Bmim]Cl (1 mL) at 80 ^oC for 8 h; Yields referred to isolated yield.

To further explore the generality and scope of this method, a wide array of 2-alkynylamines were examined, and the results are summarized in Scheme 5. A range of functional groups on the arylalkynyl moiety, including p-Me, p-OMe and *p*-Cl was tolerated under the standard reaction conditions (**5ba-5bc**). Unfortunately, only trace desired product was detected by GC-MS when 2-((4-nitrophenyl)ethynyl)aniline (4b) was used as substrate. Furthermore, 2-alkynylamines 4 with alkyl groups attached on the triple bond also proceeded well to give the products 5 in moderate to good yields (5be-5bo). Gratifyingly, the substrates containing three-, five- or six-membered-ring-substituted 2-alkynylamines proceeded smoothly under the optimized conditions to afford the corresponding products in high yields (**5be-5bi**). It is noteworthy that with the carbon chain of alkyl groups extended, the 3-sulfenylindole derivatives **5bj-5bo** were successfully obtained in good to excellent yields. Notably, 2-alkynylamines containing vinyl or thienyl groups were well tolerated, and afforded the desired products 5bp and 5bq in 71% and 63% yields, respectively.

To extend the applicability of our reaction, we then evaluated the compatibility of various arylboronic acids in this transformation (Scheme 6). Under the standard reaction conditions, various arylboronic acid derivatives with *p*-Me, *p*-MeO, *p*-F, *m*-F, *o*-F and *p*-Cl substituents were explored. These functional groups were compatible with the current procedure, and afforded the corresponding 3-sulfenylindole

The Journal of Organic Chemistry

derivatives **5ca-5cg** in 71-88% yields. Unfortunately, the coupling reactions between 2-(phenylethynyl)aniline (**4a**) and furan-2-ylboronic acid (**2h**) failed to give the desired product.

Scheme 6. Substrate scope of various arylboronic acid derivatives^a

^{*a*} Reaction conditions: **4a** (0.20 mmol), **2** (0.4 mmol), S_8 (0.60 mmol), Pd(TFA)₂ (5 mol %), CuI (0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol), K₃PO₄ (0.4 mmol), [Bmim]Cl (1 mL) at 80 °C for 8 h; Yields referred to isolated yield.

To investigate the mechanism of the cascade arylthiolation, several controlled experiments were performed (Scheme 7). Under the standard conditions, the reaction of 1,2-diphenyldisulfane a with (6) did not give the desired 2-phenyl-3-(phenylthio)benzofuran (3aa)(Eq. 1). Furthermore, when 2-phenylbenzofuran (7) and disulfide (6) were allowed to react under the standard conditions, the same result was also obtained and no desired product was detected (Eq.

ACS Paragon Plus Environment

2). In addition, the control experiment of а potential intermediate 3-chloro-2-phenylbenzofuran (8) with disulfide (6) also was investigated by following the current procedure, and the result showed that no target product **3aa** was observed by GC-MS analysis (Eq. 3).^{10a} All of these observations indicated that disulfide (6), 2-phenylbenzofuran (7) and 3-chloro-2-phenylbenzofuran (8) were not involved in this chemical process. Finally, when 3-chloro-2-phenylbenzofuran (8) was employed to react with thiophenol (9) under the standard conditions, no reaction occurred at all, which further suggested that the reaction did not proceed via a chlorocyclization process (Eq. 4).

On the basis of the above results and the reported mechanism, a tentative mechanism is proposed in Scheme 8. Initially, Pd complex is formed *in situ* in ionic liquids. ^{12, 13}

Then, nucleopalladation of 2-alkynylphenols or 2-alkynylamines afforded vinyl palladium intermediate I.¹⁶ Simultaneously, organocopper thiolate complex II is generated *in situ* from the reaction of elemental sulfur (S₈) with aryl boronic acid in the presence of CuI complex.¹⁷ Subsequently, intermediate I underwent the transmetallation process with organocopper thiolate complex II to provide intermediate III. Finally, a reductive elimination gives the target product. It is noteworthy that a silver mirror reaction was observed after the reaction was finished.¹⁸ Hence, the resulting palladium(0) is additionally oxidized to palladium(II) to complete this catalytic cycle.

Scheme 8. Proposed mechanism

CONCLUSION

In conclusion, we have successfully accomplished an attractive strategy for direct assembly of 3-sulfenylbenzofurans and 3-sulfenylindoles *via* palladium/copper catalyzed cascade annulation/arylthiolation of 2-alkynylphenols or 2-alkynylamines with arylboronic acid and S_8 in ionic liquids. This observation provides a novel route for direct accessing 3-sulfenylbenzofurans and 3-sulfenylindoles in good to excellent yields and good functional groups tolerance with high atom efficiency. Further investigation of the reaction mechanism as well as the synthetic potential applications of this protocol, is currently under way.

EXPERIMENTAL SECTION

General methods. Melting points were measured by a melting point instrument and were uncorrected. ¹H and ¹³C NMR spectra were recorded by using a 400 MHz NMR spectrometer. The chemical shifts are referenced to signals at 7.24 and 77.0 ppm, respectively, and chloroform is used as a solvent with TMS as the internal standard. IR spectra were obtained either as potassium bromide pellets or as liquid films between two potassium bromide pellets with an infrared spectrometer. GC-MS was obtained using electron ionization. The data of HRMS was carried out on a high-resolution mass spectrometer (LCMS-IT-TOF). TLC was performed by using commercially available 100-400 mesh silica gel plates (GF₂₅₄). Unless otherwise noted, all purchased chemicals were used without further purification. The 2-alkynylphenols and 2-alkynylamines were prepared according to the literature.¹⁹

General Procedure for Cascade Annulation/Arylthiolation

Pd(TFA)₂ (5 mol %) and [Bmim]Cl (1 mL) were combined in an Schlenk tube equipped with a stir-bar and stirred at room temperature for 10 min. A balloon filled with N₂ was connected to the Schlenk tube via the side tube and purged 3 times. Then **1** (0.20 mmol), **2** (0.4 mmol), **S**₈ (0.60 mmol), CuI (0.40 mmol), Phen (0.44 mmol), Ag₂CO₃ (0.4 mmol) and K₃PO₄ (0.4 mmol) were quickly added to the tube under N₂ atmosphere and stirred at 80 °C for 8 h. After the reaction was completed, the N₂ gas was released carefully and the reaction was quenched by water and extracted with CH₂Cl₂ three times. The combined organic layers were dried over anhydrous Na₂SO₄ and evaporated under vacuum. The desired products were obtained in the corresponding yields after purification by flash chromatography on silica gel with hexanes/ethyl acetate. Compounds **3ab-3af**, **3ah**, **3aj-3am**, **3ao-3ar**, **3at**, **3au**, **3aw**, **3ax**, **3bc**, **3bh**, **5ac-5ak**, **5bc-5bp**, **5cc**, **5cd** and **5cg** are all new compounds.
