Received February 15, 2016; accepted March 16, 2016

Three new acylated triterpene saponins, acernikoenosides A-C (1–3), were isolated from the stem bark of *Acer nikoense*, together with a known sterol glucoside. Their structures were elucidated on the basis of extensive spectroscopic analyses. This study provided the first example of triterpene saponins isolated from this plant. The anti-genotoxic activity of 1, 3 and 4 against ultraviolet irradiation was evaluated by comet assay.

Key words Acer nikoense; triterpene saponin; Aceraceae

*Acer nikoense* MAXIM. (Japanese name: Megusurino-ki) is an Aceraceous plant native to Japan, of which the stem bark has been used traditionally for the treatment of eye disorders and hepatic disease.<sup>1)</sup> A variety of phenolic compounds including diarylheptanoids,<sup>2–11)</sup> phenylbutanoids,<sup>4,12)</sup> coumarinolignans,<sup>13)</sup> neolignans,<sup>14)</sup> tannins<sup>15)</sup> and flavonoids<sup>12)</sup> have been reported as the constituents of *A. nikoense*. Some of these compounds show various biological activities such as anti-oxidant,<sup>16)</sup> anti-inflammatory,<sup>9)</sup> hepatoprotective,<sup>17)</sup> osteogenic,<sup>18)</sup> vasorelaxant,<sup>19)</sup> melanogenesis inhibitory,<sup>11,16)</sup> nitric oxide (NO) production inhibitory<sup>8,20)</sup> and sodium glucose cotransporter (SGLT) inhibitory activities.<sup>10)</sup>

We have been investigating edible and medicinal plants effective for the suppression of genotoxicity to discover new chemopreventive agents. Since the *n*-BuOH-soluble fraction from the MeOH extract of the stem bark of *A. nikoense* exhibited an anti-genotoxic effect against UV-irradiation in screening, we explored the chemical constituents of this fraction, resulting in the isolation of three new acylated olean-type triterpene saponins (1–3), together with a known sterol glucoside (4). Herein, we describe the isolation, structure elucidation and biological activity evaluation of the isolated compounds (Fig. 1).

The stem bark of *A. nikoense* was extracted with MeOH at room temperature. After removal of the solvent, the MeOH extract was partitioned successively between EtOAc, *n*-BuOH and  $H_2O$ . These fractions were evaluated for their anti-genotoxic activity by comet assay.<sup>21)</sup> The *n*-BuOH-soluble fraction exhibited significant activity in a dose-dependent manner (data not shown). Therefore, repeated column chromatography of this fraction over silica gel, octadecyl silica (ODS) and purification by reversed-phase (RP) HPLC was carried out to afford compounds **1** (38 mg), **2** (11 mg), **3** (7 mg) and

**4** (45 mg). Compound **4** was identified as  $\beta$ -sitosterol-3-*O*- $\beta$ -D-glucopyranoside<sup>22)</sup> by comparison of its spectroscopic data with those reported in the literature.

Compound 1 was obtained as an optically active amorphous powder. The molecular formula of 1 was determined as  $C_{51}H_{80}O_{21}$  (*m*/*z* 1051.5087 [M+Na]<sup>+</sup>) by the high-resolution electrospray ionization (HR-ESI)-MS. The <sup>1</sup>H-NMR spectrum exhibited the signals due to seven tertiary methyls ( $\delta_{\rm H}$  0.77, 0.85, 0.89, 0.94, 1.08, 1.08, 1.19), two acetyl groups ( $\delta_{\rm H}$  1.96, 2.00), one trisubstituted olefin [ $\delta_{\rm H}$  5.32 (brt, 3.2)], two oxygenated methines [ $\delta_{\rm H}$  4.95 (d, 10.5), 5.28 (d, 10.5)], along with signals ascribable to three anomeric protons [ $\delta_{\rm H}$  4.30 (d, 7.2), 4.47 (d, 7.8), 4.70 (d, 7.7)]. The <sup>13</sup>C-NMR and distortionless enhancement by polarization transfer (DEPT) spectra showed the presence of nine methyl carbons ( $\delta_{\rm C}$  15.9, 16.9, 17.7, 19.8, 20.7, 20.7, 26.6, 28.5, 29.3), eight  $sp^3$  methylene carbons ( $\delta_{\rm C}$ 19.3, 19.3, 24.6, 27.1, 28.2, 33.9, 39.8, 46.8), three sp<sup>3</sup> methine carbons ( $\delta_{\rm C}$  43.0, 48.9, 57.0), six sp<sup>3</sup> quaternary carbons ( $\delta_{\rm C}$ 36.9, 37.8, 40.4, 40.6, 42.9, 53.2), three oxygen-bearing sp<sup>3</sup> methines ( $\delta_{\rm C}$  74.9, 77.3, 91.5), one  $sp^2$  methine ( $\delta_{\rm C}$  125.1), one  $sp^2$  quaternary carbon ( $\delta_{\rm C}$  142.9), and three carbonyl carbons ( $\delta_{\rm C}$  171.8, 172.3, 177.5). Furthermore, it represented 17 carbon resonances assignable to a pentose and two hexoses. Acid hydrolysis of 1 with 5% H<sub>2</sub>SO<sub>4</sub> provided D-glucose and L-arabinose, which were identified by HPLC analysis.<sup>23)</sup> These data were similar to those of dipterosides A-D, acylated olean-type triterpene saponins previously isolated from Dipteronia dveriana (Aceraceae),<sup>24)</sup> implying 1 was also an acylated olean-type triterpene saponin. This was further confirmed based on the two-dimensional (2D)-NMR correlations shown in Fig. 2. The <sup>1</sup>H–<sup>1</sup>H correlation spectroscopy (COSY) spectrum revealed the connectivity of C-2 to C-3, C-5 to C-6, C-9 to C-12, C-18 to C-19, and C-21 to C-22. The locations of

Fig. 1. The Structures of New Compounds

Fig. 2. Key COSY and HMBC Correlations of 1

hydroxyl groups were elucidated to be at C-3, C-21 and C-22 from the heteronuclear multiple bond coherence (HMBC) correlations of H<sub>3</sub>-23 ( $\delta_{\rm H}$  1.08) and H<sub>3</sub>-24 ( $\delta_{\rm H}$  0.85) with C-3 ( $\delta_{\rm C}$ 91.5), C-4 ( $\delta_{\rm C}$  40.4), C-5 ( $\delta_{\rm C}$  57.0), and of H<sub>3</sub>-29 ( $\delta_{\rm H}$  0.89) and  $H_3$ -30 ( $\delta_H$  1.08) with C-19 ( $\delta_C$  46.8), C-20 ( $\delta_C$  36.9) and C-21 ( $\delta_{\rm C}$  77.3). The relative configuration of the C-3 hydroxyl group was assigned as  $\beta$  equatorial from the J-value of the H-3 signal observed in pyridine- $d_5$  [ $\delta_{\rm H}$  3.19 (dd, 3.9, 11.7)]. The chair conformation of E-ring and axial orientations of H-21 and H-22 were determined from the large coupling constant  $(J_{21,22}=10.5 \text{ Hz})$  and the rotating frame Overhauser effect, and exchange spectroscopy (ROESY) correlation of H-21 with H-16 $\alpha$ , H-19 $\alpha$  and H<sub>3</sub>-29, and of H-22 with H-18 and H<sub>3</sub>-30. The HMBC correlations of H-21 with C-1' ( $\delta_{\rm C}$  172.3), and of H-22 with C-1" ( $\delta_{\rm C}$  171.8) suggested that two acetyl groups were attached at C-21 and C-22 hydroxyl groups. The sequence of  $\alpha$ -L-arabinopyranosyl-(1 $\rightarrow$ 4)-[ $\beta$ -D-glucopyranosyl- $(1\rightarrow 2)$ ]- $\beta$ -D-glucopyranosyl and its attachment to the C-3 hydroxyl group were deduced from the HMBC correlation of H-1" (inner glucose H-1) with C-3, H-1"" (terminal glucose H-1) with C-2" (inner glucose C-2), and of H-1"" (arabinose H-1) with C-4" (inner glucose C-4), coupled with the Jvalues of anomeric protons (H-1": 7.8 Hz, H-1"": 7.7 Hz, H-1""": 7.2 Hz). From these findings, the structure of 1, designated acernikoenoside A, was determined as shown (Fig. 1).

A pseudo-molecular ion peak at m/z 1091.5420 [M+Na]<sup>+</sup>

(calcd for 1091.5403) observed in the HR-ESI-MS of 2 indicated a molecular formula of C54H84O21. The 1H- and 13C-NMR spectra of 2 were correlated with those of 1 (Tables 1, 2), but differ in the occurrence of signals ascribable to an angeloyl group {a carbonyl carbon ( $\delta_{\rm C}$  168.6), a sp<sup>2</sup> quaternary carbon  $(\delta_{\rm C} \ 128.8)$ , a  $sp^2$  methine [ $\delta_{\rm H} \ 6.14$  (dq, 1.4, 7.2);  $\delta_{\rm C} \ 139.9$ ], a secondary methyl [ $\delta_{\rm H}$  1.94 (brdd, 1.4, 7.2);  $\delta_{\rm C}$  16.0], and a tertiary methyl [ $\delta_{\rm H}$  1.82 (brt, 1.4);  $\delta_{\rm C}$  20.7] instead of signals due to an acetyl group seen in 1. The location of the angeloyl group at C-21 was determined from the HMBC correlation of H-21 [ $\delta_{\rm H}$  5.07 (d, 10.4)] with the carbonyl carbon. The remaining structure including the relative configuration of triterpene unit and the absolute configuration of sugar units were elucidated to be the same as 1 by the interpretation of 1D and 2D-NMR data of 2 and acid hydrolysis of 2 followed by the HPLC analysis. Therefore, the structure of 2 was characterized as shown in Fig. 1.

Compound **3** was found to possess a molecular formula of  $C_{58}H_{90}O_{21}$  by the HR-ESI-MS experiment. The analyses of the 1D and 2D-NMR data of **3** revealed that **3** had the same structure as **1** and **2** except for the acyl moiety attached at the C-21 hydroxyl group. The acyl moiety at C-21 was clarified as a (2*E*,4*E*)-6-methylocta-2,4-dienoyl moiety from the <sup>1</sup>H-<sup>1</sup>H COSY correlations of H-2'-H-3'-H-4'-H-5'-H-6'-(H<sub>3</sub>-9')-H<sub>2</sub>-7'-H<sub>3</sub>-8' and the coupling constants of H-2' [ $\delta_{\rm H}$  5.78 (d, 15.3)], H-3' [ $\delta_{\rm H}$  7.23 (dd, 10.9, 15.3)], H-4' [ $\delta_{\rm H}$  6.23

 $\delta$  ppm, 125 MHz. nd: not detected. \*Detected by the HMBC experiment.

(dd, 10.9, 15.2)] and H-5' [ $\delta_{\rm H}$  6.08 (dd, 7.9, 15.2)], together with the HMBC cross peaks of H-21, H-2' and H-3' with C-1' ( $\delta_{\rm C}$  168.4). The identification of D-glucose and L-arabinose were carried out in the same manner as **1** and **2**. Thus, the structure of **3** was elucidated as shown (Fig. 1), although the stereo-chemistry of C-6' remained to be determined.

The anti-genotoxic activity against UV-irradiation was tested for 1, 3 and 4 by comet assay, but none displayed positive activity.

### Conclusion

Our investigation on the constituents of the *n*-BuOH-soluble fraction of *A. nikoense* has led to the isolation of three new acylated olean-type triterpene saponins (1–3), named acernikoenosides A–C. Although several triterpene saponins have been isolated from Aceraceous plants,<sup>24–26)</sup> this appears to be the first example of the isolation of triterpene saponins from *A. nikoense*. The anti-genotoxic activity against UV-irradiation was evaluated for compounds 1, 3 and 4, but unfortunately they were inactive. Therefore, further study on the chemical constituents of this plant is necessary to clarify the active components.

#### Experimental

General Experimental Procedures Optical rotations were measured on a JASCO P-2200 polarimeter. IR spectra were recorded on a JASCO FT-IR-6200. HR-ESI-MS were obtained on a Waters PREMIER2695. NMR spectra were measured on a Bruker AVANCE-500 instrument using residual solvent signals as internal standards. Column chromatography was carried out with silica gel 60 (0.040-0.063 mm; Merck, Germany), silica gel PSQ 100B (Fuji Silysia Chemical, Japan) and Chromatorex ODS (100-200 mesh; Fuji Silysia Chemical). Analytical HPLC for identification of the sugar was carried out on a Shimazu apparatus consisting of a LC-6AD pump, a DGU-20A3 degasser, and a SPD-M20AP photodiode array detector (at a wavelength of 250 nm) with COSMOSIL 5C<sub>18</sub>-AR-II (5 µm, 4.6 i.d.×250 mm, Nacalai Tesque, Japan). Preparative HPLC was performed on a JAi apparatus LC-9201R/U (Japan Analysis Industry Ltd., Japan) consisting of a S-310A model II UV detector (at a wavelength of 210 nm) and a RI-50s refractive index detector with COSMOSIL 5C<sub>18</sub>-AR-II (5 $\mu$ m, 20 i.d.×250 mm, Nacalai Tesque) or COSMOSIL  $\pi$ NAP (5  $\mu$ m, 20 i.d.×250mm, Nacalai Tesque).

Extraction and Isolation The stem bark of A. nikoense (1.9 kg), purchased from Tochimoto Tenkaido Co., Ltd. (Lot. 122614002), was extracted with MeOH (5L), three times at room temperature for 96h each time. After removal of solvents, the MeOH extract (64g) was successively partitioned with EtOAc, n-BuOH and H2O. The n-BuOHsoluble fraction (17g) was chromatographed over silica gel  $[CHCl_3:MeOH:H_2O$  (10:1:0.1 $\rightarrow$ 6:4:1)] to afford sixteen fractions. Fraction 5 was recrystallized from MeOH to furnish  $\beta$ -sitosterol-3-O-glucoside (45 mg). Fraction 10 was separated by a Chromatorex ODS column [MeOH:H<sub>2</sub>O  $(1:9\rightarrow 1:0)$ ] to give fractions 10.1-10.14. Fraction 10.10 was purified by HPLC on a COSMOSIL  $\pi$ NAP (MeOH:H<sub>2</sub>O=7:3; 9.0 mL/ min) to give 1 (38 mg). The purification of fr. 10.11 by HPLC on COSMOSIL 5C<sub>18</sub>-AR-II (MeOH:H<sub>2</sub>O=3:1; 9.0 mL/min) gave 2 (11 mg). Fraction 10.13 was purified by HPLC on COSMOSIL  $\pi$ NAP (MeOH:H<sub>2</sub>O=4:1; 9.0 mL/min), yielding

compound 3 (7 mg).

Acid Hydrolysis of 1–3 and Identification of the Sugar Compounds 1–3 (each at 1.0 mg) were separately hydrolyzed with 5% H<sub>2</sub>SO<sub>4</sub> (2 mL) at 80°C for 4h. Each solution was diluted with H<sub>2</sub>O, and extracted with EtOAc. The H<sub>2</sub>O layer was neutralized with Amberlite IRA-900 resin and evaporated *in vacuo*. The residue was reacted with L-cysteine methyl ester hydrochloride (1.5 mg) in pyridine (1 mL) at 60°C for 1 h, and then *o*-tolyl isothiocyanate (50  $\mu$ L) was added to the reaction mixture and reacted at 60°C for 1 h. The reaction mixture was directly analyzed by HPLC on a COSMOSIL 5C<sub>18</sub>-AR-II (CH<sub>3</sub>CN:50 mM H<sub>3</sub>PO<sub>4</sub>=25:75; 0.8 mL/min; 17°C).<sup>23)</sup> The *t*<sub>R</sub> values of the two peaks detected at 18.6 min and 21.0 min were consistent with those of *o*-tolylthiocarbamoyl-thiazolidine derivatives synthesized from D-glucose and L-arabinose.

## **Biological Activity**

Cell Culture

TK6 human lymphoblastoid cells were cultured in RPMI1640 medium containing 10% horse serum,  $200 \mu g/mL$  sodium pyruvate and  $200 \mu g/mL$  streptomycin, and incubated at 37°C in a humidified atmosphere with 5% CO<sub>2</sub>–95% air.

UV-Irradiation to Cells

Cells were suspended in saline in a 6 cm dish to prepare  $5 \times 10^5$  cells/mL suspension. This suspension was exposed to UVC radiation at  $80 \text{ J/m}^2$  using a germicidal lamp.

Comet Assay

After UV-irradiation, cells were post-treated with each sample for 30 min. Treated cells were suspended in 1% agarose-low gelling temperature (LGT) at  $5 \times 10^5$  cells/75  $\mu$ L, and 75  $\mu$ L of the cell suspension was immediately deposited on a fully frosted slide, which was coated with 1% agarose GP-42 and then covered with another slide glass. The slides were placed in order to allow the agarose to gel. The samples on the slides were then immediately exposed to a lysing solution (pH 10) of 2.5 M NaCl, 100 mM ethylenediaminetetra-

acetic acid (EDTA) disodium (Na2EDTA), 10mm Trizma, 1% sarkosyl, 10% dimethyl sulfoxide (DMSO) and 1% Triton X-100, and left at 4°C for 1 h. The slides were then placed on a horizontal gel electrophoresis platform and covered with a pH >13 alkaline solution consisting of 300mm NaOH and 1mm Na<sub>2</sub>EDTA. The slides were left at 0°C for 20min to allow unwinding of the DNA and expression of alkali-labile sites to occur. The power supply was set at 1 V/cm and 250 mA. The DNA was subject to electrophoresis at 0°C for 20min and the slides were rinsed with 400mM Trizma (pH 7.5) to neutralize the excess alkalinity. Each slide was stained with  $50 \mu L$ of 20 µg/mL ethidium bromide and covered with a cover slip. Fifty cells on one slide per slide (one slide was prepared for each plate and 2 plates were prepared for each dose) were examined and photographed at ×200 magnification using a fluorescence microscope equipped with a G filter. The whole length of the whole comet (head to tail) was measured manually using a scale for 50 nuclei.
