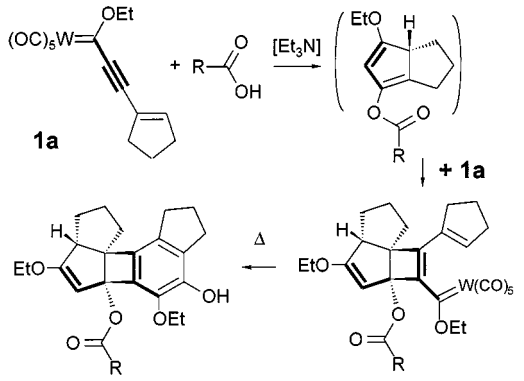
Bicyclic olefins containing a 1-oxy-3-thiocyclopentadiene unit were obtained with high regioselectivity from [2-(cycloalk-1-enyl)-1-alkynyl]carbene complexes **1a–d** and thiols **2a–c** under mild conditions. If the reaction was performed in a protic solvent like ethanol, the produced allylthiocyclopentadienes **5** spontaneously underwent a thio Claisen rearrangement to give cyclopentene-1-thione complexes **3** in 62–72% yields. In nonprotic solvents, additional cyclopentene-1-thione complexes **6** and **7** were obtained as a result of the incorporation of two and three allylthiol units, respectively. Arylthiotetrahydroindene complexes **12b** and **c** could be isolated in 76–79% yields. The corresponding tetrahydropentalene derivative **12a** was unstable, but could be trapped by [2+2] cycloaddition of (1-alkynyl)carbene complex **1a** to give a stable (cyclobutenyl)carbene complex **15**. Hydrolysis of compounds **12a–c** afforded cyclopenten-1-ones **13a–c**.

Introduction

(1-Alkynyl)carbene complexes $(CO)_5M{=}C(OEt)C{\equiv}CR$ (M = Cr, W) have been utilized as stoichiometric reagents in a number of high-yield transformations, potentially useful in organic synthesis.[2] We recently reported on the formation of cyclopentadienes[3] by π-cyclization of 1-metalla-1,3,5-hexatrienes,[4,5] which were readily derived from [2-(cyclopent-1-enyl)-1-alkynyl]carbene complex **1a** by addition of protic nucleophiles NuH.[6] For example, formation of cyclopentadienes could be triggered by addition of secondary amines R_2NH, secondary phosphanes R_2PH (R = *t*Bu, *c*C_6H_{11}),[7] and oxygen nucleophiles[8] ROH (R = aryl, aroyl and acyl), respectively, to (1-alkynyl)carbene complex **1a**. Whilst nitrogen or phosphorus nucleophiles led to production of cyclopentadiene complexes, oxygen nucleophiles gave highly reactive, metal-free cyclopentadienes, such as 1-acyloxy-3-alkoxytetrahydropentalenes. The latter compounds underwent a cascade of reactions initiated by the formation of a tricyclic [2+2] cycloadduct with (1-alkynyl)carbene complex **1a**, which on thermolysis underwent a π-cyclization involving an insertion of carbon monoxide to give a pentacyclic compound (Scheme 1).[8,9]



Scheme 1. Cascade reaction initiated by addition of oxygen nucleophiles RCO_2H to [2-(cyclopent-1-enyl)-1-alkynyl]carbene tungsten complex **1a**

Reaction of sulfur nucleophiles, like thioacylates $RC(=O)S^-$ or thio(imino)acylates $RC(=NH)S^-$, with [2-(cycloalk-1-enyl)-1-alkynyl]carbene complexes **1a–c** were found to afford bicyclic cyclopentadienes containing sulfur substituents.[1] We now wish to report that the allylthiocyclopentadienes **5** thus generated spontaneously underwent a thio Claisen rearrangement to give cyclopentene-1-thione complexes **3** in 62–72% yields (Scheme 2, Table 1).

Generation and Thio Claisen Rearrangement of Allylthiocyclopentadiene Complexes 5

Addition of allylthiol (**2a**) to {[2-(cycloalk-1-enyl)-1-alkynyl]carbene}tungsten complexes **1a−c** in ethanol in the presence of triethylamine at 20 °C (5 min) resulted in the formation of cyclopentene-1-thione complexes **3**, in which an allyl group was attached to the bridgehead carbon atom (Scheme 2). Compounds **3** are stable enough to be isolated by chromatography on silica gel, since the $W(CO)_5$ unit functions as a protection group for the thione moiety. Metal-free thiones of this type would not survive these conditions.[10,11]

Formation of compounds **3** is assumed to follow the reaction paths outlined in Scheme 2. Though 1-metalla-1,3,5-hexatrienes **4** and cyclopentadiene complexes **5** have not been characterized in this case, the reaction course can be presumed on the basis of earlier studies, in which such compounds have been isolated and fully characterized by crystal structure analyses.[1,7]

The structural assignment of compounds **3** is based on ^1H and ^{13}C NMR spectra, including $^3J(H,H)$- and $^{2,3}J(C,H)$ measurements and a crystal structure analysis of compound **3b** (Figure 1). The W−S1−C2−C3 backbone is planar [dihedral angle = 0.00°; angle C2−S1−W = 113.6(2)°] and the plane defined by this unit bisects the angle between two neighbouring carbonyl ligands [C21−W−S1−C2 = 45.0(1)°]. The C2−C3 distance of 1.392(5) Å is much shorter than expected for a C−C single bond, and is similar to C3−C4 [1.325(7) Å], implying a strong π-polarization with a negative charge at $W(CO)_5^-$ and a positive charge centred at the allyl unit C2−C3−C4, in line with the downfield shift of the signals of these carbon atoms in the NMR spectrum (e.g. compound **3b**: C4: δ = 194.7; C3: δ = 120.6; C2: δ = 239.9).

A marked influence of the solvent on the reaction of [2-(cycloalk-1-enyl)-1-alkynyl]carbene complexes **1** and allylthiol (**2a**) has been observed. Whilst compounds **3** were produced in good yields if ethanol was used as solvent, additional products **6** and **7** were obtained in aprotic solvents, such as diethyl ether (Scheme 3).

Compounds **6** and **7** were isolated by chromatography and were characterized spectroscopically. It was shown on the basis of NMR measurements that the cyclopentenones **6** were not formed by thiolysis of compounds **3** under the reaction conditions, even if the reaction time was extended to 12 h (at 20 °C). Furthermore, similar studies ruled out possible derivation of compounds **7** from compounds **6**. Accordingly, it is assumed that 2,4-bis(allylthio)-1-metalla-1,3,5-hexatrienes **8** are formed as key intermediates by substitution of the 2-ethoxy group of compounds (3*E*)-**4** by an allylthio unit (Scheme 3, Table 2). π-Cyclization of compounds **8** and subsequent thio Claisen rearrangement are presumed to afford allyl derivatives **6**. Addition of a third allylthiol (**2a**) is assumed to require formation of chelate intermediates **10** as precursors to cyclopentadiene derivatives **11**, from which compounds **7** are finally obtained. It

should be noted that reactions involving a chain extension of allyl-type carbene complexes have not been reported to date.

In an attempt to provide experimental evidence that 1-oxy-3-thiotetrahydropentalenes, -indenes and -hexahydroazulenes were indeed generated from [2-(cycloalk-1-enyl)-1-alkynyl]carbene complexes (Schemes 2 and 3), we studied the formation of supposedly more stable arylthio derivatives of this type. Compounds of the latter type could indeed be obtained, but were found to readily undergo (base-induced) rearrangement reactions and also (acid-induced) hydrolysis, depending on the reaction conditions.

Reaction of (1-Alkynyl)carbene Complexes 1a−c with Arylthiols 2b and c

Addition of arylthiols **2b** and **c** to [2-(cyclohex-1-enyl)-1-alkynyl]carbene complex **1b** (20 °C, 2 h) yielded tetrahydroindene derivatives **12b** and **c**, which could be isolated from the reaction mixture by crystallization (Scheme 4, Table 3). Attempts to isolate compounds **12a**,**b** and **d** by chromatography on silica gel led to the production of (metal-free) tetrahydropentalenone **13a**, -tetrahydroindenone **13b** and -hexahydroazulenone **13d**, respectively.[12] Application of an excess of (1-alkynyl)carbene complex **1a** in its reaction with phenylthiol **2b** resulted in the formation of a [2+2] cycloadduct **15a** between the highly reactive tetrahydropentalene **14a** and compound **1a**.[8,13] [2+2] Cycloadducts (**15b** and **c**) to the SC=C units of tetrahydroindene- and hexahydroazulenes **14b** and **14d** were not obtained. If the reaction between (1-alkynyl)carbene complex **1a** and compound **2b** was performed in the presence of triethylamine at −20 °C, it resulted in the formation of an isomer (**17a**) of compound **12a** in 85% isolated yield. (1-Alkynyl)-carbene complex **1b** under similar conditions gave tetrahydroindene complexes **16b** and **c**, which could be isolated in 80−82% yield by crystallization, but which were transformed into tetrahydroindenones **18** if chromatography on silica gel was attempted.

The structural assignment of compounds **12**−**18** is based on ^{1}H- and ^{13}C-NMR spectra. The compounds are easily distinguished by the different chemical shifts of the olefinic proton signals, each in a narrow range, for cyclopentadienes (e.g. **12b**: 2-H: δ = 5.18; **16b**: 2-H: δ = 5.02; **16c**: 2-H: δ = 5.13) and cyclopentenones (e.g. **13b**: 2-H: δ = 5.59), a characteristic signal shift of the methine proton signals of isomers **12**, **16** and **17** (e.g. **12b**: 3a-H: δ = 2.86; **16b**: 1-H: δ = 3.93; **17a**: 2-H_2: δ = 3.56), and the characteristic pattern of CH_2 and =CH signals of isomers **13** and **18** (e.g. **13a**: 2-H: δ = 5.60; **18a**: 2-H_2: δ = 2.07). Hydrolysis of cyclopentadienes **12** to cyclopentenones results in drastic changes in chemical shifts (e.g. **12b/13b**: C-1: δ = 143.0/182.1; C-2: δ = 100.9/123.5; C-3: δ = 169.1/203.7). It should be noted that

systematic shift changes are imposed by ring strain effects within the bicyclic system (e.g. **13a**: 3a-H and 6a-H/C-3a and C-6a: δ = 2.94 and 2.59/52.5 and 48.7; **13b**: 3a-H and 7a-H/C-3a and C-7a: δ = 2.62 and 2.30/47.5 and 43.2; **13d**: 3a-H and 8a-H/C-3a and C-8a: δ = 2.90 and 2.44/52.6 and 49.2; **18a**: C-3a and C-6a: δ = 181.9 and 151.2; **18b**: C-3a and C-7a: δ = 168.6 and 141.4).[14]

Structural details for the (cyclobutenyl)carbene complex **15a** were derived from a crystal structure analysis (Figure 2). The W=C4−C5=C51 unit is twisted by 120.7(4) °, whilst the C5=C51−C52=C56 moiety adopts an almost planar *s-trans* configuration with an dihedral angle of −178.8(4)°. The cyclobutenyl ring exhibits a trapezoidal shape, with the typical pattern of bond lengths [C5=C51 = 1.360(4) Å, C5−C6 = 1.532(4) Å, C51−C61 = 1.513(4) Å, C6−C61 = 1.598(4) Å] and bond angles [C51−C5−C6 = 93.7(2)°, C5−C51−C61 = 95.1(2)°, C5−C6−C61 = 85.3(3)°, C51−C61−C6 = 85.5(2)°].

Structural details for compound **17a** were also obtained by a crystal structure analysis (Figure 3). The plane defined by the atoms W, S1 and C130 is strongly inclined against the almost planar adjacent ring [W−S1−C2−C3 =

Cyclopentenones **13** could be readily obtained in a one-pot procedure by reaction of [2-(cycloalk-1-enyl)-1-alkynyl]-carbene complexes **1a−c** with phenylthiol (**2b**) in ethanol (instead of diethyl ether) (Scheme 5, Table 4).

Experimental Section

All operations were carried out under argon. All solvents were dried and distilled prior to use. − All ^{1}H- and ^{13}C-NMR spectra were routinely recorded with Bruker ARX 300 and AM 360 instruments. − IR spectra were recorded with a Biorad Digilab Division FTS-45 FT-IR spectrophotometer. − Elemental analysis were determined with a Perkin−Elmer 240 elemental analyser. − Analytical TLC plates, Merck DC-Alufolien Kieselgel 60$_{F240}$, were viewed by UV light (254 nm) and stained by iodine. R_f values refer to TLC tests. Chromatographic purifications were performed on Merck Kieselgel 100. Pentacarbonyl[3-(cyclopent-1-enyl)-1-ethoxy-2-propyn-1-ylidene]tungsten (**1a**), pentacarbonyl[3-(cyclohex-1-enyl)-1-ethoxy-2-propyn-1-ylidene]tungsten (**1b**), pentacarbonyl[3-(cyclohept-1-enyl)-1-ethoxy-2-propyn-1-ylidene]tungsten (**1c**) and pentacarbonyl[3-(cyclohex-1-enyl)-1-ethoxy-2-propyn-1-ylidene]-chromium (**1d**) were prepared according to ref.[7]

(6a-Allyl-3-ethoxy-4,5,6,6a-tetrahydro-3a*H*-pentalene-3-thione-*S*)-pentacarbonyltungsten (3a), (6a-Allyl-3-allylthio-4,5,6,6a-tetrahydro-3a*H*-pentalene-3-thione-*S*)pentacarbonyltungsten (6a) and (6a-Allyl-3-allylthiopropylthio-4,5,6,6a-tetrahydro-3a*H*-pentalene-3-thione-*S*)pentacarbonyltungsten (7a): Pentacarbonyl(3-cyclopentenyl-1-ethoxy-2-propyn-1-ylidene)tungsten (**1a**) (236 mg, 0.50 mmol) was added with stirring at 20 °C to allylthiol (**2a**) (37 mg, 0.50 mmol) and triethylamine (25 mg, 0.25 mmol) in 2 mL of ethanol in a 2 mL screw-top vessel. Compound **1a** was completely consumed within 5 min, to give a orange solution. The solvent was removed after 0.5 h at 20 °C and the residue was separated by rapid chromatography on silica gel (column 20 × 2 cm) with *n*-pentane/dichloromethane (10:1) to afford an orange fraction containing compound **3a** (169 mg, 62%, R_f = 0.4 in *n*-pentane/dichloromethane, 5:1; m.p. 67 °C). If the reaction was performed in diethyl ether (instead of ethanol) for 6 h at 20 °C, it afforded two violet compounds **6a** and **7a** in addition to compound **3a**. Rapid chromatography on silica gel (column 20 × 2 cm) with *n*-pentane/dichloromethane (10:1) gave compound **6a** (101 mg, 37%, R_f = 0.5 in *n*-pentane/dichloromethane, 5:1, violet crystals from *n*-pentane at −15 °C, m.p. 49 °C), an orange fraction containing compound **3a** (46 mg, 17%) and a red fraction of compound of **7a** (41 mg, 13%, R_f = 0.3 in *n*-pentane/ dichloromethane, 5:1, red oil). Compounds **3a, 6a** and **7a** are unstable in solution.

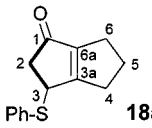
Compound 13d: ^{1}H NMR (C_6D_6): δ = 7.28 ("d", 2 H, *o*-H Ph), 7.00 (m, 3 H, *m*-H and *p*-H Ph), 5.63 (s, 1 H, 2-H), 2.90 and 2.44 (each m, each 1 H, 3a-H and 8a-H), 1.89 (m, 2 H), 1.68−1.16 (m, 8 H). − ^{13}C NMR (C_6D_6): δ = 204.2 (C_q, C=O), 182.3 (C_q, C-3), 134.8, 129.9 and 129.3 (each CH, 2:2:1, Ph), 130.0 (C_q, *i*-C, Ph), 125.5 (CH, C-2), 52.6 and 49.2 (each CH, C-3a and C-8a); 31.3, 31.0, 28.2, 27.6 and 27.4 (each CH_2, C-4−C-7). − IR (diethyl ether): $\tilde{\nu}$ (%) = 1698.6 cm^{-1} (70) [ν(C=O)]. − MS (70 eV), *m*/*z*

(%): 258 (100) [M^+]. − $C_{16}H_{18}OS$ (258.4): calcd. C 74.38, H 7.02; found C 74.11, H 7.10.

3-Phenylthio-3,4,5,6-tetrahydro-2*H*-pentalen-1-one (18a): To pentacarbonyl(3-cyclopentenyl-1-ethoxy-2-propyn-1-ylidene)tungsten (**1a**) (236 mg, 0.50 mmol) in 1 mL of hexane was added dropwise with stirring at 20 °C a solution of thiophenol (**2b**) (55 mg, 0.50 mmol) and triethylamine (20 mg, 0.80 mmol) in 1 mL of *n*-pentane. After the mixture was stirred for 4 h at 50 °C, the solvent was removed and the residue was separated by chromatography on silica gel (column 20 × 2 cm) with *n*-pentane/diethyl ether, 4:1, to give a colourless oil containing compounds **13a** and **18a** (48 mg, 42%, **18a**:**13a** = 5:2, R_f = 0.4 in *n*-pentane/diethyl ether, 2:1).

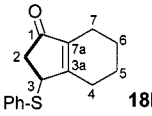
Compound 13a: See above.



18a

Compound 18a: ^{1}H NMR (C_6D_6): δ = 7.21 (m, 2 H, *o*-H Ph), 6.97 (m, 3 H, *m*-H and *p*-H Ph), 3.67 (d, 1 H, 3-H), 2.75 (m, 1 H), 2.28 (m, 1 H), 2.07 (d, 2 H, 2-H_2), 2.02−1.74 (m, 3 H), 1.28 (m, 1 H). − ^{13}C NMR (C_6D_6): δ = 197.7 (C_q, C=O), 181.9 (C_q, C-3a), 151.2 (C_q, C-6a), 134.7 (C_q, *i*-C, Ph); 131.9, 129.2 and 127.5 (each CH, 2:2:1, Ph), 49.6 (CH, C-3), 43.2 (CH_2, C-2), 30.2, 27.5 and 25.0 (each CH_2, C-4−C-6). − IR (hexane): $\tilde{\nu}$ (%) = 1708.5 cm^{-1} (70) [ν(C=O)]. − MS (70 eV), *m*/*z* (%): 230 (100) [M^+], 121 (80) [M^+ − SPh]. − $C_{14}H_{14}OS$ (230.3): calcd. C 73.02, H 6.13; found C 72.75, H 6.54.

3-Phenylthio-2,3,4,5,6,7-hexahydro-inden-1-one (18b): Pentacarbonyl(3-cyclohexenyl-1-ethoxy-2-propyn-1-ylidene)tungsten (**1b**) (243 mg, 0.50 mmol) was treated with thiophenol (**2b**) (55 mg, 0.50 mmol) in 2 mL of *n*-pentane in the presence of triethylamine. Workup as described above afforded a polar, colourless oil containing compound **18b** (47 mg, 39%, R_f = 0.6 in *n*-pentane/diethyl ether, 2:1).



18b

Compound 18b: ^{1}H NMR (C_6D_6): δ = 7.21 (m, 2 H, *o*-H Ph), 6.97 (m, 3 H, *p*- and *m*-H Ph), 3.63 (d, 1 H, 3-H), 2.50 (m, 3 H), 2.00 (d, 2 H, 2-H_2), 1.77 (m, 1 H), 1.30 (m, 4 H). − ^{13}C NMR (C_6D_6): δ = 203.0 (C_q, C=O), 168.6 (C_q, C-3a), 141.4 (C_q, C-7a), 134.2 (C_q, *i*-C, Ph); 132.5, 129.1 and 127.6 (each CH, 2:2:1, Ph), 48.2 (CH, C-3), 43.8 (CH_2, C-2); 26.4, 22.3, 21.6 and 20.5 (each CH_2, C-4−C-7). − IR (hexane): $\tilde{\nu}$ (%) = 1705.6 cm^{-1} (70) [ν(C=O)]. − MS (70 eV), *m*/*z* (%): 244 (90) [M^+]. − $C_{15}H_{16}OS$ (244.3): calcd. C 73.73, H 6.60; found C 73.64, H 6.53.

3-(2-Methoxyphenylthio)-2,3,4,5,6,7-hexahydroinden-1-one (18c): Pentacarbonyl(3-cyclohexenyl-1-ethoxy-2-propyn-1-ylidene)-tungsten (**1b**) (243 mg, 0.50 mmol) was treated with thiophenol (**2c**) (70 mg, 0.50 mmol) in 2 mL of *n*-pentane in the presence of triethylamine as described above to give the polar compound **18c** (62 mg, 45%, R_f = 0.7 in *n*-pentane/diethyl ether, 2:1, colourless oil]. − ^{1}H NMR (C_6D_6): δ = 7.27 and 6.47 (each "d", each 1 H, 3-H and 6-H of C_6H_4), 7.02 and 6.75 (each "t", each 1 H, 4-H and 5-H of C_6H_4), 3.85 (d, 1 H, 3-H), 3.32 (s, 3 H, OCH_3), 2.50 (m, 3 H), 2.04 (s, 2 H, 2-H_2), 1.81 (m, 1 H), 1.28 (m, 4 H). − ^{13}C NMR (C_6D_6): δ = 203.6 (C_q, C=O), 169.1 (C_q, C-3a), 159.2 (C_q, C-2 of C_6H_4), 141.4 (C_q, C-7a), 133.5 and 129.0 (each CH, C-6 and C-4 of C_6H_4), 123.3 (C_q, *i*-C of C_6H_4), 121.1 and 111.2 (each CH, C-3 and C-5 of C_6H_4), 55.2 (CH_3O), 47.0 (CH, C-3), 44.3 (CH_2, C-2); 26.6, 22.3, 21.6 and 20.6 (each CH_2, C-4−C-7). − IR (hexane): $\tilde{\nu}$ (%) = 1703.1 cm^{-1} (70) [ν(C=O)]. − MS (70 eV), *m*/*z* (%): 274 (70) [M^+]. − $C_{16}H_{18}O_2S$ (274.1): calcd. C 70.07, H 6.62; found C 70.33, H 6.74.
