#### Abstract

The total syntheses of $\beta$-carboline alkal oids, (R)-(-)-pyridindolols (1, 5, and $\mathbf{6}$ ) are described. The two key steps involved are (1) a thermal electrocyclic reaction of the 3 -alkenylindole2-aldoxime $\mathbf{1 0}$ and (2) a thermal cyclization of 3-alkynylindole-2-aldoxime $\mathbf{1 1}$ to construct the $\beta$-carboline N -oxides 8, which upon heating with acetic anhydride and sequential treatment with trifluoromethanesulfonic anhydride gave the triflates 18 . The Stille coupling reaction of $\mathbf{1 8}$ with vinylstannane, followed by cleavage of MOM ether, afforded the 1-ethenyl-3-hydroxymethyl- $\beta$ carboline (7a). Subsequent acetylation of $\mathbf{7 a}$ yielded the acetate $\mathbf{7 b}$, which was subjected to the Sharpless asymmetric 1,2-dihydroxylation by AD-mix- $\beta$ to produce (R)-(-)-pyridindolol K2 (6). Selective acetylation of $\mathbf{6}$ was effected by $\mathrm{Ac}_{2} \mathrm{O}$ and collidine to form (R)-(-)-pyridindolol K1 (5). By contrast, hydrolysis of 6 provided (R)-(-)-pyridindolol (1).

## Introduction

Pyridindolol (1) was isolated from Streptomyces alboverticillatus as a $\beta$-galactosidase inhibitor by Umezawa and co-workers in 1975. ${ }^{1 \mathrm{a}}$ The structure has been elucidated by spectroscopic and X-ray crystall ographic analyses to be 1-[1(R),2-dihydroxy]-3-hydroxymethyl-9H-pyrido-[3,4-b]indole. ${ }^{1 \mathrm{~b}} \mathrm{~A}$ structure-activity study has al so been reported, with the data indicating that both hydroxy groups at $\mathrm{C}-14$ and $\mathrm{C}-15$ positions and the $\beta$-carboline nucleus are essential for the activity of pyridindolol in inhibiting $\beta$-galactosidase. ${ }^{1 \mathrm{C}}$ In addition, three pyridindolol glucosides (2-4) have been isolated from Streptomyces parvulus, strain Tu2480 by Hagmann and coworkers. ${ }^{2}$ Their structures were determined by spectroscopic investigations and degradation to pyridindolol and $\alpha, D-m e t h y I$ glucoside. Recently, the closely related pyridindolol K1 (5) and pyridindolol K2 (6) were isolated from Streptomyces sp. K93-0711 together with pyridindolol (1) by Omura and co-workers. ${ }^{3}$ The conversion of pyridindolol K2 (6) to pyridindolol (1) has been carried out with sodium methoxide in methanol, with the absolute structures of $\mathbf{5}$ and $\mathbf{6}$ subsequently being determined to have the same stereochemistry as 14 R of $\mathbf{1}$ by the CD spectrum. It has been also reported that pyridindolol K2

[^0]inhibits the adhesion of HL-60 cells to the LPS-activated HUVEC monolayer ( $\mathrm{IC}_{50}=75 \mu \mathrm{~g} / \mathrm{mL}$ ).

Two synthetic works regarding pyridindolol (1) have appeared. The first total synthesis of racemic pyridindolol (1) and (S)-(+)-pyridindolol (1) was reported by Cook and co-workers. ${ }^{4}$ They employed Pictet-Spengler condensation of dl-tryptophan methyl ester with ( R )-glyceraldehyde acetonide ( $60 \%$ optical purity) to produce the 1,2,3,4-tetrahydro- $\beta$-carbol ine acetonide as a mixture of diastereomers, enriched in the S-isomer ( $\left[\alpha{ }^{233_{\mathrm{D}}}-11^{\circ}\right.$ ), which were subjected to aromatization with $5 \% \mathrm{Pd}-\mathrm{C}$ in refluxing cumene to provide the optically inactive $\beta$-carboline acetonide al ong with racemization. However, the optically active $\beta$-carboline acetonide with dextrorotatory direction ( $[\alpha]^{23}{ }^{\mathrm{D}}+5.5^{\circ}$ ) was obtained by DDQ oxidation in benzene. Finally, total syntheses of racemic pyridindolol (1) and (S)-(+)-pyridoindolol ( $\mathbf{(})\left([\alpha]^{23} \mathrm{D}+7.7^{\circ}\right.$ ) were established by two additional steps. At approximately the same time, Hamaguchi and Ohki ${ }^{5}$ also reported that dehydrogena-

[^1]tion of trihydroxy-1,2,3,4-tetrahydro- $\beta$-carboline, prepared from the condensation of tryptophanol and glyceraldehyde, with Pd/C does not lead to pyridindolol (1), and Cook ${ }^{4}$ reported a similar failure for dihydroxy-1,2,3,4-tetrahydro- $\beta$-carboline.

In the course of our study, we have developed the syntheses of biol ogically active condensed heteroaromatic compounds, including natural products, based on a thermal electrocyclic reaction ${ }^{6}$ of either hexatriene ${ }^{7,8}$ or azahexatriene ${ }^{7,9}$ systems incorporating a principal aromatic or heteroaromatic moiety. Recently, we communicated the first enantioselective total synthesis of (R)-(-)-pyridindolol K2 (6) and its enantiomer. ${ }^{10}$ We here describe the details of the total synthesis of pyridindolol K2 (6) based on the construction of a $\beta$-carboline N -oxide framework 8 using two different ways of a thermal electrocyclic reaction of the 1-azahexatriene system 10 involving the indole 2,3-bond and a thermal cyclization of 3-alkynylindole-2-aldoxime $\mathbf{1 2}$ according to a modified Sakamoto's method, ${ }^{11}$ followed by asymmetric 1,2-dihydroxylation of 1-ethenyl- $\beta$-carboline 7 as depicted in the retrosynthetic Scheme 1. In addition, we describe the total syntheses of (R)-(-)-pyridindolol K1 (5) and (R)-(-)-pyridindolol (1), starting from (R)-(-)-pyridindolol K2 (6), respectively.

## Results and Discussion

For the synthesis of $\beta$-carboline N -oxides $\mathbf{8}$ based on a thermal electrocyclic reaction of the 1-azahexatriene system 10, we chose 3-i odoindole-2-carbal dehyde (12a) ${ }^{8 a}$ and N -methoxymethyl(MOM)-3-iodoindole-2-carbaldehyde (12b) ${ }^{8 a}$ as starting materials. The palladiumcatalyzed cross-coupling reaction ${ }^{12}$ of 12a (or 12b) with tributyl[3-(MOM oxy)prop-1-en-1-yl]stannane (13), prepared from 3-(MOM oxy)prop-1-yne ${ }^{13}$ and tributyltin hy-

dride, in the presence of $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ and $\mathrm{Et}_{4} \mathrm{NCl}$ in DMF gave the 3-alkenylindole 14a (or 14b) in a 83\% (or 96\%) yield. After the aldehyde 14a (or 14b) was converted to the oxime 10a (or 10b) as a 1-azahexatriene system, it was subjected to a thermal electrocyclic reaction in o-dichlorobenzene to produce the $\beta$-carboline $\mathbf{9 a}$ (or 9b) in $71 \%$ and $98 \%$ yields from 10a and 10b, respectively. Subsequent oxidation of $\mathbf{9 a}$ (or $\mathbf{9 b}$ ) with $m$-chloroperbenzoic acid (mCPBA) afforded the $\beta$-carboline N -oxide 8a (97\%) [or 8b (89\%)]. By contrast, we utilized the same starting materials 12a and 12b for the synthesis of $\beta$-carboline N -oxides 8 based on thermal cyclization using a modified Sakamoto's method. ${ }^{11}$ Specifically, the pal-Iadium-catalyzed cross-coupling reaction of 12a (or 12b) with tributyl[3-(M OM oxy)prop-1-yn-1-yl]stannane (15), prepared from 3-(MOM oxy)prop-1-yne ${ }^{13}$ and tributyltin chloride with n-BuLi, in the presence of $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}$ and $\mathrm{Et}_{4} \mathrm{NCI}$ in DMF, gave the 3-alkynylindole 16a (or 16b) in a $48 \%$ (or $97 \%$ ) yield. Treatment of 16a (or 16b) with hydroxylamine furnished the indole-3-aldoxime 11a (42\%) [or 11b (93\%)], which was then subjected to a thermal cyclization in o-dichlorobenzene to produce the $\beta$-carboline N -oxide 8a (45\%) [or 8b (95\%)] (Scheme 2). Two routes for the synthesis of $\beta$-carboline N -oxides 8 were established. The total yields of the former route in the four steps from 12a or $\mathbf{1 2 b}$ to $\mathbf{8 a}$ or $\mathbf{8 b}$ were $41.7 \%$ and $79.5 \%$, respectively. In addition, the total yields of the latter route in the three steps from 12a or $\mathbf{1 2 b}$ to $\mathbf{8 a}$ or $\mathbf{8 b}$ were $9.1 \%$ and $85.7 \%$, respectively. On the basis of these results, it is obvious that a protecting group of indole nitrogen atom is essential for both routes. Although the latter route resulted in a slightly better total

yield than the former route, the two types of thermal ring closures for the construction of this fused pyridine ring system provided excellent results.

Next, the synthesis of 1 -ethenyl- $\beta$-carboline 7 was attempted using the $\beta$-carboline N -oxides $\mathbf{8 a}$ and $\mathbf{8 b}$. As shown in Scheme 3, heating of $\mathbf{8 a}$ (or $\mathbf{8 b}$ ) with acetic anhydride at reflux temperature, followed by treatment of the resulting 1-hydroxy- $\beta$-carboline 17a (67\%) [or 17b (90\%)] with trifluoromethanesulfonic anhydride ( $\mathrm{Tf}_{2} \mathrm{O}$ ) and pyridine, afforded the triflates 18a (93\%) and 18b (99\%), respectively. The triflate 18a (or 18b) was subjected to the palladium-catalyzed cross-coupling reaction with ethenyl tributylstannane in the presence of $\mathrm{PdCl}_{2}-$ $\left(\mathrm{PPh}_{3}\right)_{2}$ and $\mathrm{Et}_{4} \mathrm{NCl}$ in DMF to give the 1-ethenyl- $\beta$ carbolines 19a (87\%) and 19b (72\%). Synthesis of the 1,3disubstituted $\beta$-carboline nucleus 19 was completed in a three-step sequence.

Finally, deprotection of 19b with trifluoromethanesulfonic acid, MeOH , and trimethyl orthoformate in nitromethane at $100{ }^{\circ} \mathrm{C}^{9 i}$ yielded 1-ethenyl-3-hydroxy-methyl- $\beta$-carboline (7a) (93\%). The Sharpless asymmetric
dihydroxylation reaction ${ }^{14}$ of the resultant 7a with AD-mix-a or AD-mix-b in a 1:1 mixture of t-BuOH and water did not give any pyridindolol (1), which may have been due to a problem with the solubility of 7a. Thereupon, the alcohol 7a was converted by the usual procedure to the acetate $\mathbf{7 b}$ (98\%).
The asymmetric 1,2-dihydroxylation of $\mathbf{7 b}$ with AD-mix- $\alpha$ was carried out in a 1:1 mixture of $\mathrm{t}-\mathrm{BuOH}$ and water to provide (S)-(+)-pyridindolol K2 (6) in a $66 \%$ yield (ee 99.2\%). In contrast, the reaction of 7b with AD-mix- $\beta$ was carried out similarly to produce (R)-(-)-pyridindolol (6) in a $68 \%$ yield (ee $99.6 \%$ ). In addition, the selective acetylation of $\mathbf{6}$ with acetyl chloride and collidine ${ }^{15}$ at $-78{ }^{\circ} \mathrm{C}$ for 5 h afforded (R)-(-)-pyridindolol K1 (5) (76\%) together with (R)-(-)-pyridindolol triacetate (20) (15\%). Furthermore, hydrolysis of the acetate $\mathbf{6}$ with 1 $\mathrm{M}_{2} \mathrm{CO}_{3}$ in methanol according to the reported procedure ${ }^{3}$ afforded (R)-(-)-pyridindolol (1) (93\%) (Scheme 4). The synthetic (R)-(-)-pyridindol ol K2 (6), (R)-(-)-pyridindolol K1 (5), and (R)-(-)-pyridindolol (1) were identical in all respects, including their specific rotation, to data ${ }^{1,3}$ reported for the natural products.

## Conclusions

The first enantioselective total synthesis of (R)-(-)pyridindolol K2(6) together with its enantiomer (S)-(+)-6 was established in a nine-step or ten-step sequence based on the construction of $\beta$-carboline N -oxide (8) through the thermal electrocydic reaction of a 1-azahexatriene system (10) involving the indole 2,3 -bond or the thermal cyclization of 3 -ethynylindole-2-carbaldehyde oxime (11), followed by the Sharpless asymmetric 1,2-dihydroxylation of 7b. In addition, the asymmetric total syntheses of (R)-(-)-pyridindolol K1 (5) and (R)-(-)-pyridindolol (1) were also completed using $\mathbf{6}$ as a starting material.
