The reactions of substituted ethenes with β -keto esters in the presence of a mixture of manganese(II) and manganese(III) acetates, and molecular oxygen yielded substituted 1,2-dioxan-3-ols **3** in 14–95% yields. Cobalt(III) acetate, potassium permanganate, lead(IV) acetate, copper(II) acetate, chromium(VI) trioxide, thallium(III) acetate, ammonium cerium(IV) nitrate and iron(III) perchlorate were also used in place of manganese(III) acetate. Effects on the product yields of substituents in the alkenes and β -keto esters have been examined and reaction mechanisms are discussed.

We recently reported that manganese(III) or manganese(III) acetate-mediated free-radical cyclisation of alkenes with 1,3-diones 1 or acetoacetamides, 2 and molecular oxygen yielded 1,2-dioxan-3-ols 3 in good yields. It was found that the reaction of alkenes with acetoacetamide and oxygen in the presence of manganese(III) acetate gave compounds 3 most effectively. Manganese(III) acetate, on the other hand, gave better yields for the reaction of alkenes and 1,3-diketones having active methine and oxygen, but not for active methylene compounds which were best transformed into compounds 3 with manganese(III) acetate. 1b,c We have further examined the reaction of alkenes with β -keto esters and oxygen in the presence of various transition-metal salts with particular attention to the role of manganese(III) acetate, and the results are described in this paper.

Results and Discussion

Reactions of 1,1-Diphenylethene 1a with Ethyl 3-Oxobutanoate 2a and Oxygen in the Presence of Various Metal Salts or Oxide.—Reaction of 1,1-diphenylethene 1a with ethyl 3-oxobutanoate 2a in the presence of manganese(II) acetate under a dry air stream gave ethyl cis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate 3aa (Scheme 1; Table 1, entry 1). The structural assignment was based on the ¹H NMR, ¹³C NMR and IR spectra, and elemental analysis, as well as on the compound's similarity to 4-acetyl-3-methyl-1,2-dioxan-3-ol. The structure of the latter was confirmed by X-ray crystallography. 1a,b The yield was improved up to 68-72% either by performing the reaction for longer reaction time (entry 2) or at an elevated temperature (entry 3). However, either ethyl 2-methyl-5,5-diphenyl-4,5-dihydrofuran-3-carboxylate 4aa or benzophenone 5a was formed as a by-product. The reaction under a stream of oxygen also yielded 5a and 2,2-diphenyl-2hydroxyethyl acetate 6a as minor products (Fig. 1; entry 4). By carrying out the reaction using a small amount of manganese(III) acetate at a 1:3:0.1 molar ratio for 1a:2a: MnIII-(OAc), under a dry air stream, only 3aa was obtained in a comparable yield (65%), other by-products not being formed, although one-third of the unchanged alkene was recovered (entry 5). In the reaction at a molar ratio of 1:3:1 for 1a: 2a: Mn^{III}(OAc)₃ the products again consisted of 3aa and 4aa (entry 8). Thus, it seemed that the reaction using a mixture of Mn^{II}(OAc)₂ and a small amount of Mn^{III}(OAc)₃ at a lower temperature could be a better reagent for the formation of 1,2dioxan-3-ols via the alkene-β-keto ester-oxygen intermolecular cyclisation. Before investigating the reaction further in detail, other metal salts were examined. Copper(II), nickel(II) and thallium(III) acetates were not reactive. Chromium(VI) trioxide

and cobalt(III) acetate were reactive, but not effective for the formation of 3aa (entries 11 and 12). The reactions of potassium permanganate, and ammonium cerium nitrate (CAN) in acetic acid and acetonitrile gave 3aa in rather unsatisfactory yields (entries 10, 13 and 14). The reaction of 1a with 2a in the presence of iron(III) perchlorate in acetic acid yielded 4aa, 5a and ethyl 2-methyl-5-phenylfuran-3-carboxylate 7 (entry 15).

Scheme 1

Reactions using a combination of manganese(II) acetate and various oxidizing reagents under a current of dry air at 23 °C (Table 2) were then investigated. The reaction of 1a and 2a with a 1:0.1 molar mixture of manganese(II) and manganese(III) acetates gave the maximum yield for 3aa (95%, entry 17). Manganese(II)—cobalt(III) acetates yielded similar result (entry 18). Potassium permanganate, chromium(vI) trioxide, thallium(III) acetate, and CAN in combination with manganese(II) acetate also proved to be excellent reagents (entries 19, 22, 23 and 24). Thus, the combination of a 1:0.1 molar mixture of manganese(II)—manganese(III) acetates was chosen for further investigation since it gave the best yield for the 1,2-dioxan-3-ol.

Reactions with Various Alkenes.—The reactions were exam-

ined for 1,1-bis(4-fluorophenyl)ethene 1b, 1,1-bis(4-chlorophenyl)ethene 1c, 1,1-bis(4-methylphenyl)ethene 1d, 1,1-bis(4-methoxyphenyl)ethene 1e, styrene 1f, (Z)-1,2-diphenylethene 1g and (E)-1,2-diphenylethene 1h, and 1,1,2-triphenylethene 1i (Table 3, entries 26–33). The reactions with 1,1-diaryl substituted ethenes 1b—e and styrene 1f gave good yields for the corresponding ethyl 3-hydroxy-3-methyl-1,2-dioxane-4-carboxylates 3ba-fa, but 1,2-disubstituted alkenes, such as (Z)-1,2-diphenylethene 1g and (E)-1,2-diphenylethene 1h, gave the products in poor yields. Compounds 1g and 1h both gave the

same 1,2-dioxan-3-ol 3ga. 1,1,2-Triphenylethene 1i gave 5a and 2-hydroxy-1,2,2-triphenylethyl acetate 6i. 2-Ethylbut-1-ene, oct-1-ene and cyclohexene gave a mixture of undefined compounds. Thus, it seems that the reaction is limited to phenyl substituted ethenes.

Reactions with Various β-Keto Esters.—The reactions were examined for methyl 3-oxobutanoate 2b, propyl 3-oxobutanoate 2c, butyl 3-oxobutanoate 2d, tert-butyl 3-oxobutanoate 2e, ethyl benzoylacetate 2f, 2-acetylbutyrolactone 2g, ethyl 2-oxocyclopentanecarboxylate 2h and ethyl 2-oxocyclohexanecarboxylate 2i with 1a. The results are summarized in Table 3 (entries 34–41). In the reaction of 2h, an acetate 8 and a dimeric compound 9 were obtained along with 3ah (Fig. 1). The structure of 8 can be assigned as cis-fused 1-acetoxy-5-ethoxycarbonyl-3,3-diphenyl-2-oxabicyclo[3.3.0]octane 8 since a trans-fused bicyclo[3.3.0] system would be highly strained.

Structural Assignments.—In contrast to the reaction of acetoacetamides, which gave an equilibrium mixture of two stereoisomers, the reactions of β -keto esters yielded a single stereoisomer. The ¹H NMR spectrum of **3aa** showed the presence of an ethoxy group at δ 1.27 (3 H, t, J 7.0 Hz) and 4.17 (2 H, q, J 7.0 Hz), a methyl group at δ 1.38 (3 H, s), a –CH₂-CH < unit at δ 2.83 (3 H, m), and two phenyl groups at δ 7.2-7.5 (10 H, m). The CH₂CH unit in **3aa** was shown as an ABX spin system (δ_A 4.09, δ_B 4.87, δ_X 5.55, J_{AB} 12.3, J_{AX}

Fig. 2 MM2 calculation of 3aa, 3ag and 3ai

12.3 and $J_{\rm BX}$ 3.9 Hz) when the spectrum was taken with the aid of a shift reagent, $[{\rm Eu}({\rm fod})_3]$. The two large coupling constants ($J_{\rm AB}=J_{\rm AX}$ 12.3 Hz) indicated that a hydrogen at the 4-C position had an axial conformation (Fig. 2). The configuration at the 3-C was determined on the basis of MM2 calculations. The calculations were performed only on their chair conformations and it was found that (Z)-3aa $[OH(a), CO_2Et(e)]$ had a lower energy (19.3 kcal mol⁻¹) than (E)-3aa $[OH(e), CO_2Et(e); 19.6$ kcal mol⁻¹]. The lower energy of (Z)-3aa, which has an axial hydroxy group, could be ascribed to an anomeric effect. MM2 calculations were also carried out for

3ag and 3ai in order to determine the relative stabilities of the possible conformations. The results indicated that among possible four stereostructures for 3ag, (E)-3ag (e,e) possesses a lower energy than others. By inspection of a computer-drawn picture of (E)-3ag (e,e), it was shown that (E)-3ag (e,e) has a 'twist boat' form for the 1,2-dioxane ring, probably because of the presence of the neighbouring butyrolactone ring. It was also shown that a *trans*-fused bicyclo[4.4.0] ring for 3ai is more stable than a *cis*-fused one.

Although compound 3aa is a single stereoisomer, treatment of 3aa with camphor-10-sulfonic acid in methanol gave a mixture of two isomeric methyl ethers 11aa and 11aa', which could not be separated into individual isomers on a silica gel plate. The ¹H NMR spectrum (60 MHz; CDCl₃) of the mixture showed two singlets for methyl groups at the 3-C position at δ 1.37 for 11aa (major component) and δ 1.30 for 11aa' (minor component) with intensities being 3.2:1. The ¹³C NMR spectrum (22.5 MHz; CDCl₃) indicated the presence of the methyl group at the 3-C position and the methylene carbon (5-C), which resonated at δ 14.14 and 31.15 for 11aa, and δ 15.53 and 34.37 for 11aa'. These spectral data indicate that the methyl group at the 3-C position in 11aa is axial, and that in 11aa' is equatorial (Fig. 3). The assignments were based on the steric compression effect between the methyl group and the methylene (5-C) as has been observed in the case of 4-carbamoyl-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxanes; ² compared with the equatorial methyl group, the axial 3-methyl group resonated at a slightly lower field in the ¹H NMR spectrum and at a slightly higher field in ¹³C NMR spectrum. An upfield shift of the methylene carbon in 11aa is in harmony with the presence of the axial methyl group at the 3-C position.

Reaction of Ethyl 3-Methoxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylates 11aa and 11aa'.—In order to examine whether the 1,2-dioxane ring is stable or not towards the nucleophilic reagent, the reactions of the methyl ethers 11aa and 11aa' with methyl- and phenyl-magnesium halides were carried out. The reactions yielded 4-(1-hydroxy-1-methylethyl)-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane 12 and 4-(hydroxydiphenylmethyl)-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane 13, respectively. It was thus demonstrated that the carbonyl group at the 4-C position can be converted into other functional groups without a change in the 1,2-dioxane ring system.

Reaction Mechanisms.—The reaction may be accounted for in terms of radical reactions initiated by 1-ethoxycarbonyl-2-oxopropyl radicals A, 'CH(COMe)CO₂Et, formed by the interaction of manganese(III) acetate and ethyl 3-oxobutanoate 2a (Scheme 2). We attempted unsuccessfully to purify a TLC fraction which, showing the presence of several ethoxy groups in

Heaa
$$Mn^{II}(eaa)_{n-1}$$

Heaa $Mn^{II}(eaa)_{n-1}$

Scheme 2

Scheme 3

its ¹H NMR spectrum, we thought might contain a dimeric compound of 2a. Nevertheless, formation of radicals A is supported by the formation of dimeric compounds 9 and 10 in the reactions of ethyl 2-oxocyclopentanecarboxylate 2h and ethyl 2-oxocyclohexanecarboxylate 2i, respectively. Reaction of radicals A with an alkene gives stable carbon radicals B, which either trap oxygen to form peroxyl radicals C or are oxidized to the corresponding cations D. Under the reaction conditions described, that is, in a dry air stream and at room temperature, the former path should be favoured. Reduction with Mn^{II} of the peroxyl radicals C would give the peroxyl anions E which would then equilibrate with the cyclized alkoxyl anions F. The latter, abstracting a proton from solvent, would give 3aa. However, the path $B \rightarrow D$ became competitive for reactions both at an elevated temperature and for those with a higher concentration of manganese(III) acetate; the carbocations D cyclize and are deprotonated to yield 4aa. Manganese(II) acetate, manganese-(III) acetate, potassium permanganate and CAN are able to produce 3aa when they are used alone as shown in Table 1. Cobalt(III) acetate reacted with an alkene to yield 5a and 6a. This could be accounted for in terms of the higher redox potential⁴ and more inert nature of cobalt(III) acetate compared with manganese(III) acetate. Iron(III) perchlorate reacted

with 2a and 1a to yield 4aa and 7, but did not give 3aa. However, it seems that 3aa can be converted into 7 under acid conditions and a similar conversion has been observed in the acid-catalysed reaction of 4-acetyl-3-methyl-6,6-diphenyl-1,2-dioxan-3-ol. 1c In fact, treatment of 3aa with perchloric acid gave 7 in quantitative yield. A plausible mechanism is shown in Scheme 3.

We described in a previous paper how compounds 5a could be derived from 6a. However, when the reactions were carried out under an atmosphere of oxygen (Table 1, entries 4 and 9), the yields of 5a increased markedly. Electron transfer processes account for the formation of 6a. 5.6 To account for the formation of 5a, on the other hand, it is reasonable to assume that the radical intermediates J, formed by the reaction of 1a with manganese(III) acetate, would also react with oxygen to give peroxyl radicals L. The latter upon decomposition via a hydroperoxide M would yield 5a, acetic acid and formaldehyde (detected as its 2,4-DNP; Scheme 4). In harmony with our view the reaction of 2-hydroxy-2,2-diphenylethyl acetate 6a with

1a

manganese(III) acetate at 23 °C failed to give 5a, unchanged 6a being recovered.

As has been shown in Table 2, the combination of manganese(II) and manganese(III) acetates is a far more effective reagent for 1,2-dioxan-3-ol formation than either separately: thus manganese(II) acetate itself can give 3aa in better yield at room temperature, but takes longer whilst manganese(III) acetate tends to give a mixture of 3aa and 4aa. Manganese(11) acetate itself could not be oxidized to manganese(III) acetate by oxygen alone, but when oxygen was bubbled through an acetic acid solution of manganese(II) acetate containing ethyl 3oxobutanoate 2a, the solution turned brown in 7 h and showed its λ_{max} at 447 nm, which is the same as manganese(III) acetate in acetic acid.⁷ The solution then turned colourless at room temperature after several hours and gave a white precipitate, which was found to be anhydrous manganese(II) acetate. It is known that bis(pentane-2,4-dionato)manganese(II) is unstable towards oxygen, particularly in solution, and tends to be oxidized to tris(pentane-2,4-dionato)manganese(III) even at room temperature.8 This suggests that 2a plays an important role in transforming manganese(II) to manganese(III) species during aerobic oxidation. The role of the other oxidant used in the reaction should also be to oxidize Mn^{II} ions to Mn^{III}. Thus, the Mn^{III} complex was formed from Mn^{II} either by the reaction with another oxidant molecule or oxygen and then an ethyl acetoacetate (abbreviated Heaa)-coordinated Mn^{III} complex, for which a formula of Mn^{III}(eaa), G was tentatively assigned, would decompose to produce the radicals A. The reduced Mn^{II}(eaa), H would then give back Mn^{II}(eaa), I, thus being recycled.

The fact that the Mn^{III} complex is a labile one, ⁹ must be also responsible for the ease of formation of the radicals A; acetate ion, axially coordinated to the Mn^{III} ions, could be exchanged quickly with ethyl acetoacetate, which then splits off from Mn^{II} as radical A after being oxidized. Iron(III) perchlorate and CAN also showed a similar tendency, but since the cobalt(III) complex would be a stable species at room temperature it would not produce radicals A in the reaction. Contrary to our expectations, the reaction of 1a and 2a in the presence of Mn^{II} or Mn^{III} under a pure oxygen atmosphere gave either only a poor or no yield of 3aa, although the yield of 5a increased. Since a large quantity of complex products was formed, which had no aromatic hydrogen in its ¹H NMR spectrum, it seems to be likely that there is some reaction between radicals A and oxygen.

It seems possible that the radicals A staying in the proximity of the Mn^{III} ion react successively with alkene and oxygen which are coordinated to the Mn^{III} ion in a manner similar to Snider's mechanism for the reaction of α,α' -dicarbonylmethyl radicals with alkene.¹⁰

Conclusions.—Manganese(II and III)-mediated reaction of alkenes, β -keto esters and O_2 give 1,2-dioxan-3-ols in excellent yields. Whilst 1,1-diarylethenes always give good yields, 1,2-diarylethenes are less reactive. Alkenes having no phenyl substituent give no 1,2-dioxan-3-ols. Both acyclic and cyclic β -keto esters gave 1,2-dioxan-3-ols.

Experimental

Measurements.—All of the 1 H and 13 C spectra were taken with a JNM PMX-60SI (60 MHz) and a JNM EX-90 FT NMR (90 MHz for 1 H and 22.5 MHz for 13 C) spectrometer with tetramethylsilane being used as the internal standard. Chemical shifts are shown as δ values and J values are in Hz. The IR spectra were measured on a JASCO A-102 IR spectrometer and the values are expressed in cm $^{-1}$. Mass spectra were measured on a JMS-DX303HF spectrometer at an ionizing voltage of 70

eV. All of the melting-points were determined with a Yanaco micromelting-point apparatus MP-J3.

Materials.—Manganese(III) acetate dihydrate 11 was prepared according to a method described in literature. 1,1-Diphenylethenes 1a—e and 1,1,2-triphenylethene 1i were prepared by dehydration of the corresponding alcohols which were synthesised from substituted acetophenones or benzophenone and arylmagnesium bromides. 12 Styrene 1f (Wako), (Z)-1,2-diphenylethene 1g (Aldrich), (E)-1,2-diphenylethene 1h (Katayama), and β-keto esters 2a–i (Wako and Tokyo-Kasei) were purchased and used as received.

Reaction of 1,1-Diphenylethene 1a with Ethyl 3-Oxobutanoate 2a in the Presence of a Metal Salt or an Oxide-Molecular Oxygen.—The general procedure for the reaction of 1,1-diphenylethene 1a with ethyl 3-oxobutanoate 2a in the presence of a metal salt or oxide and oxygen was as follows. A metal salt (0.1-1 mmol) was added to a stirred solution of 1a (1 mmol) and 2a (3 mmol) in acetic acid (25 cm³) in a three-necked flask equipped with a dry-air inlet tube. The mixture was stirred at 23 °C for the period of time shown in Table 1. The solvent was removed under reduced pressure and residue was triturated with sulfuric acid (1 mol dm³, 30 cm³), and then extracted with chloroform. The products were separated on TLC (Wakogel B10) with chloroform as the eluent. The products were further purified by recrystallization. Yields are listed in Table 1.

Ethyl cis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate 3aa. M.p. 151 °C (from ethanol) (Found: C, 70.1; H, 6.4. Calc. for $C_{20}H_{22}O_5$: 70.16; H, 6.48%); $v_{max}(CHCl_3)/cm^{-1}$ 3604 (OH) and 1729 (C=O); δ_H (90 MHz; CDCl₃; Me₄Si) 1.27 (3 H, t, J7.0, CH₂CH₃), 1.38 (3 H, s, Me), 2.83 (3 H, m, CH₂CH), 3.50–4.10 (1 H, br s, OH), 4.17 (2 H, q, J7.0, OCH₂CH₃) and 7.20–7.50 (10 H, m, 2 × Ph); δ_C (22.5 MHz; CDCl₃; Me₄Si) 171.49 (C=O), 143.22 (> C=), 140.77 (> C=), 128.44 (=CH-), 128.29 (=CH-), 127.91 (=CH-), 127.32 (=CH-), 126.71 (=CH-), 125.74 (=CH-), 98.50 (3-C), 85.12 (6-C), 61.23 (OCH₂CH₃), 45.45 (4-C), 31.71 (5-C), 24.42 (Me) and 14.08 (CH₂CH₃).

Ethyl 2-methyl-5,5-diphenyl-4,5-dihydrofuran-3-carboxylate **4aa.** Liquid (Found: m/z 308.1412. Calc. for $C_{20}H_{20}O_3$: M, 308.1376); $v_{max}(CHCl_3)/cm^{-1}$ 1685 (C=O); $\delta_H(90 \text{ MHz}; CDCl_3)$ 1.23 (3 H, t, J 7.0, CH_2CH_3), 2.33 (3 H, t, J 1.2, Me), 3.57 (2 H, q, J 1.2, CH_2), 4.10 (2 H, q, J 7.0, OCH_2CH_3) and 7.17–7.50 (10 H, m, 2 × Ph); $\delta_C(22.5 \text{ MHz}; CDCl_3)$ 166.00 (C=O), 165.45 (2-C), 145.02 (> C=), 128.11 (=CH-), 127.27 (=CH-), 125.45 (=CH-), 101.60 (3-C), 91.34 (5-C), 59.28 (OCH_2CH_3), 43.99 (4-C), 14.22 (Me) and 13.99 (Me); m/z 308 (M^+ , 30%), 262 (100), 247 (43), 191 (85) and 43 (34).

Benzophenone 5a. M.p. 48 °C (from ethanol).

2-Hydroxy-2,2-diphenylethyl acetate **6a**. M.p. 92.0–92.5 °C (from water–ethanol) (lit., ¹³ m.p. 93–93.5 °C).

Ethyl 2-methyl-5-phenylfuran-3-carboxylate 7. Liquid (Found: m/z 230.0941. Calc. for $C_{14}H_{14}O_3$: M, 230.0943); $v_{max}(CHCl_3)/cm^{-1}$ 1709 (C=O); δ_H (60 MHz; CDCl₃) 1.36 (3 H, t, J 7.0, CH₂CH₃), 2.63 (3 H, s, Me), 4.31 (2 H, q, J 7.0, OCH₂CH₃), 6.67 (1 H, s, =CH-) and 7.20-7.81 (5 H, m, Ph).

Formation of Formaldehyde 2,4-Dinitrophenylhydrazone.—A mixture of 1a (1 mmol), 2a (3 mmol), and manganese(III) acetate (0.33 mmol) in acetic acid (25 cm³) was stirred at 23 °C for 24 h. 2,4-Dinitrophenylhydrazine (1 mmol) and 2 mol dm⁻³ sulfuric acid (30 cm³) were added to the mixture, which was stirred at room temperature for 0.5 h. Then, the reaction mixture was extracted with benzene (×3), and the combined extracts were washed with a saturated aqueous sodium hydrogen carbonate, dried (Na₂SO₄) and evaporated. The residue was purified on a silica gel plate with chloroform as the eluent to give

formaldehyde 2,4-dinitrophenylhydrazone (10%), m.p. 158 °C, identical with that of an authentic sample.

Reactions of Various Alkenes with \u03b3-Keto Esters in the Presence of Manganese(II) Acetate-Oxidant and Molecular Oxygen.—The general procedure for the reaction of alkenes with β-keto esters in the presence of manganese(II) acetateoxidant and oxygen was as follows. Manganese(II) acetate (1 mmol) and an oxidant (0.1 mol. equiv.) was added to a stirred solution of an alkene 1 (1 mmol) and a β-keto ester 2 (3 mmol) in acetic acid (30 cm³) in a three-necked flask equipped with a dryair inlet tube. The mixture was stirred at 23 °C under a dry-air stream for the period of time shown in Tables 2 and 3. The solvent was removed under reduced pressure and the residue was triturated with 1 mol dm⁻³ sulfuric acid (30 cm³) and then extracted with chloroform. The products were separated on TLC (Wakogel B10) with chloroform as the eluent. The products were further purified by recrystallization. Yields are listed in Tables 2 and 3.

Ethyl cis-6,6-bis(4-fluorophenyl)-3-hydroxy-3-methyl-1,2-dioxane-4-carboxylate **3ba**. M.p. 154 °C (from ethanol) (Found: C, 63.2; H, 5.3. Calc. for C₂₀H₂₀F₂O₅: C, 63.49; H, 5.32%); $\nu_{\rm max}({\rm CHCl_3})/{\rm cm^{-1}}$ 3644 (OH) and 1684 (C=O); $\delta_{\rm H}$ (60 MHz; CDCl₃) 1.27 (3 H, t, *J* 7.0, CH₂CH₃), 1.40 (3 H, s, Me), 1.73 (1 H, br s, OH), 2.77 (3 H, m, CH₂CH), 4.03 (2 H, q, *J* 7.0, OCH₂CH₃) and 6.77–7.67 (8 H, m, ArH).

Ethyl 5,5-bis(4-fluorophenyl)-2-methyl-4,5-dihydrofuran-3-carboxylate **4ba**. Liquid (Found: m/z 344.1232. Calc. for $C_{20}H_{18}F_{2}O_{3}$: M, 344.1224); $\nu_{max}(CHCl_{3})/cm^{-1}$ 1685 (C=O); $\delta_{H}(60 \text{ MHz}; CDCl_{3})$ 1.27 (3 H, t, J 7.0, $CH_{2}CH_{3}$), 2.30 (3 H, t, J 1.2, Me), 3.50 (2 H, q, J 1.2, CH_{2}), 4.13 (2 H, q, J 7.0, $CH_{2}CH_{3}$) and 7.17–7.43 (8 H, m, ArH); m/z 344 (M⁺, 30%), 298 (100), 283 (29), 227 (41) and 43 (14).

Ethyl cis-6,6-Bis(4-chlorophenyl)-3-hydroxy-3-methyl-1,2-dioxane-4-carboxylate 3ca. M.p. 135–137 °C (from ethanol) (Found: C, 58.5; H, 4.9. Calc. for $C_{20}H_{20}Cl_2O_5$: C, 58.41; H, 4.90%); $\nu_{\rm max}({\rm CHCl_3})/{\rm cm^{-1}}$ 3604 (OH) and 1730 (C=O); $\delta_{\rm H}(90~{\rm MHz};{\rm CDCl_3})$ 1.27 (3 H, t, J 7.0, CH₂CH₃), 1.40 (3 H, s, Me), 2.77 (3 H, m, CH₂CH), 2.87–3.53 (1 H, br s, OH), 4.17 (2 H, q, J 7.0, OCH₂CH₃) and 7.17–7.67 (8 H, m, ArH); $\delta_{\rm C}(22.5~{\rm MHz};{\rm CDCl_3})$ 171.19 (C=O), 141.21 (=CCl-), 138.99 (=CCl-), 134.10 (=C <), 133.49 (=C <), 128.76 (= CH-), 128.53 (=CH-), 128.14 (=CH-), 127.23 (=CH-), 98.95 (3-C), 84.43 (6-C), 61.38 (OCH₂CH₃), 45.24 (4-C), 31.49 (5-C), 24.45 (Me) and 14.03 (CH₂CH₃).

4,4'-Dichlorobenzophenone 5c, m.p. 146-147 °C (from benzene-hexane).

Ethyl cis-3-hydroxy-3-methyl-6,6-bis(4-methylphenyl)-1,2-dioxane-4-carboxylate 3da. M.p. 152–153 °C (from ethanol) (Found: C, 71.1; H, 7.0. Calc. for $C_{22}H_{26}O_5$: C, 71.33; H, 7.08%); $v_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3600 (OH) and 1729 (C=O); $\delta_{\text{H}}(90 \text{ MHz}; \text{CDCl}_3)$ 1.27 (3 H, t, J7.0, CH₂CH₃), 1.43 (3 H, s, Me), 2.27 (3 H, s, Me), 2.33 (3 H, s, Me), 2.82 (3 H, m, CH₂CH), 3.85 (1 H, br s, OH), 4.17 (2 H, q, J 7.0, OCH₂CH₃) and 7.03–7.47 (8 H, m, ArH); $\delta_{\text{C}}(22.5 \text{ MHz}; \text{CDCl}_3)$ 171.59 (C=O), 140.52 (=C <), 137.92 (=C <), 137.76 (=C <), 136.91 (=C <), 129.14 (=CH-), 128.97(=CH-), 126.63(=CH-), 125.77(=CH-), 98.44(3-C), 85.06 (6-C), 61.19 (–OCH₂CH₃), 45.52 (4-C), 31.80 (5-C), 24.43 (Me), 21.02 (Me), 20.97 (Me) and 14.11 (CH₂CH₃).

Ethyl 2-methyl-5,5-bis(4-methylphenyl)-4,5-dihydrofuran-3-carboxylate 4da. Liquid (Found: m/z 336.1714. Calc. for C₂₂H₂₄O₃: M, 336.1726); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 1730 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 1.20 (3 H, t, J 7.0, CH₂CH₃), 2.27 (6 H, s, 2 × Me), 2.33 (3 H, t, J 1.6, Me), 3.47 (2 H, q, J 1.6, CH₂), 4.07 (2 H, q, J 7.0, OCH₂CH₃) and 7.03–7.93 (8 H, m, ArH); m/z 336 (M⁺, 19%), 294 (100), 219 (97) and 43 (13).

Ethyl cis-3-hydroxy-6,6-bis(4-methoxyphenyl)-3-methyl-1,2-dioxane-4-carboxylate 3ea. M.p. 122-123 °C (from ethanol)

(Found: C, 65.6; H, 6.55. Calc. for $C_{22}H_{26}O_7$: C, 65.66; H, 6.51%); $v_{max}(CHCl_3)/cm^{-1}$ 3596 (OH) and 1727 (C=O); δ_H (60 MHz; CDCl₃) 1.27 (3 H, t, J 7.0, CH₂CH₃), 1.40 (3 H, s, Me), 2.83 (3 H, m, CH₂CH), 3.80 (6 H, s, OMe), 3.95 (1 H, br s, OH), 4.23 (2 H, q, J 7.0, OCH₂CH₃) and 7.03–7.93 (8 H, m, ArH).

Ethyl 5,5-bis(4-methoxyphenyl)-2-methyl-4,5-dihydrofuran-3-carboxylate 4ea. Liquid (Found: m/z 368.1644. Calc. for $C_{22}H_{24}O_5$: M, 368.1624); $\nu_{max}(CHCl_3)/cm^{-1}$ 1682 (C=O); δ_H (60 MHz; CDCl₃) 1.23 (3 H, t, J 7.0, CH₂CH₃), 2.33 (3 H, t, J 1.6, Me), 3.47 (2 H, q, J 1.6, CH₂), 3.87 (6 H, s, 2 × OMe), 4.10 (2 H, q, J 7.0, OCH₂CH₃) and 6.67–7.30 (8 H, m, ArH); m/z 368 (M⁺, 36%), 322 (61), 307 (13), 251 (90) and 43 (9).

Ethyl cis-3-hydroxy-3-methyl-6-phenyl-1,2-dioxane-4-carboxylate **3fa**. M.p. 89 °C (from benzene-hexane) (Found: C, 63.2; H, 6.8. Calc. for $C_{14}H_{18}O_5$: C, 63.14; H, 6.81%); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3488 (OH) and 1729 (C=O); $\delta_{\text{H}}(90 \text{ MHz}; \text{CDCl}_3)$ 1.27 (3 H, t, J7.0, CH₂CH₃), 1.55 (3 H, s, Me), 2.09 (1 H, ddd, J2, 5 and 15, 5-H_{eq}), 2.47 (1 H, ddd, J12, 13 and 15, 5-H_{ax}), 3.10 (1 H, dd, J 5 and 12, 4-H), 3.60–3.90 (1 H, br s, OH), 4.23 (2 H, q, J7.0, OCH₂CH₃), 5.14 (1 H, dd, J 2 and 13, 6-H) and 7.17–7.50 (5 H, m, Ph); $\delta_{\text{C}}(22.5 \text{ MHz}; \text{CDCl}_3)$ 171.34 (C=O), 137.07 (=C <), 128.99 (=CH-), 128.61 (=CH-), 127.11 (=CH-), 98.56 (3-C), 81.77 (6-C), 61.28 (OCH₂CH₃), 48.45 (4-C), 29.29 (5-C), 24.48 (Me) and 14.11 (CH₂CH₃).

Ethyl 2-methyl-5-phenyl-4,5-dihydrofuran-3-carboxylate **4fa**. Liquid (Found: m/z 232.1099. Calc. for C₁₄H₁₆O₃: M, 232.1099); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 1691 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 1.23 (3 H, t, J 7.0, CH₂CH₃), 2.23 (3 H, t, J 1.6, Me), 2.83 (2 H, m, CH₂), 4.10 (2 H, q, J 7.0, OCH₂CH₃), 5.33–5.67 (1 H, m, CHPh) and 7.20–7.70 (5 H, m, Ph).

Ethyl cis-3-hydroxy-3-methyl-t-5,c-6-diphenyl-1,2-dioxane-4-carboxylate **3ga**. M.p. 89 °C (from benzene-hexane) (Found: C, 69.9; H, 6.5. Calc. for $C_{20}H_{22}O_5$: C, 70.16; H, 6.48%); $v_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3592 (OH) and 1729 (C=O); $\delta_{\text{H}}(90 \text{ MHz}; \text{CDCl}_3)$ 0.98 (3 H, t, J7.0, CH₂CH₃), 1.58 (3 H, s, Me), 3.27 (1 H, d, J 12.0, 4-H), 3.75–4.20 (1 H, br s, OH), 3.81 (1 H, dd, J 10.7 and 12.0, 5-H), 3.95 (2 H, q, J 7.0, OCH₂CH₃), 5.12 (1 H, d, J 10.7, 6-H) and 6.80–7.75 (10 H, m, 2 × Ph).

2-Hydroxy-1,2,2-triphenylethyl acetate **6i**. M.p. 226 °C (from benzene) (lit., ¹⁴ m.p. 224.5–225.5 °C).

Methyl cis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate 3ab. M.p. 183–184 °C (from ethanol) (Found: C, 69.6; H, 6.2. Calc. for $C_{19}H_{20}O_5$: C, 69.50; H, 6.14%); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3596 (OH) and 1731 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 1.40 (3 H, s, Me), 2.87 (3 H, m, CH₂CH), 3.70 (3 H, s, OMe), 3.90 (1 H, s, OH) and 7.17–7.87 (10 H, m, 2 × Ph).

Propyl cis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate **3ac**. M.p. 140–141 °C (from ethanol) (Found: C, 70.8; H, 6.8. Calc. for C₂₁H₂₄O₅: C, 70.77; H, 6.73%); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3596 (OH) and 1728 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 0.93 (3 H, t, *J* 7.0, CH₂CH₃), 1.40 (3 H, s, Me), 1.67 (2 H, m, CH₂CH₂CH₃), 2.87 (3 H, m, CH₂CH), 4.00 (1 H, s, OH), 4.10 (2 H, t, *J* 7.0, OCH₂) and 7.10–7.77 (10 H, m, 2 × Ph).

Butyl cis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate **3ad**. M.p. 121–122 °C (from ethanol) (Found: C, 71.4; H, 7.0. Calc. for $C_{22}H_{26}O_5$: C, 71.33; H, 7.08%); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 3529 (OH) and 1725 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 0.70–2.00 (7 H, m, CH₂CH₂CH₃), 1.40 (3 H, s, Me), 2.80 (3 H, m, CH₂CH), 3.87 (1 H, s, OH), 4.13 (2 H, t, *J* 7.0, OCH₂CH₂) and 7.10–7.73 (10 H, m, 2 × Ph).

tert-Butylcis-3-hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate **3ae**. M.p. 120 °C (from ethanol) (Found: C, 71.2; H, 7.05. Calc. for $C_{22}H_{26}O_5$: C, 71.33; H, 7.08%); $\nu_{max}(CHCl_3)/cm^{-1}$ 3596 (OH) and 1721 (C=O); δ_H (60 MHz; CDCl₃); δ 1.37 (3 H, s, Me), 1.47 (9 H, s, CMe₃), 2.80 (3 H, m, CH₂CH), 4.13 (1 H, br s, OH) and 7.03–7.63 (10 H, m, 2 × Ph).

Ethyl 1-acetoxy-3,3-diphenyl-2-oxabicyclo[3.3.0]octane-5-carboxylate **8**. Liquid (Found: m/z 394.1823. Calc. for $C_{24}H_{26}O_5$: M, 394.1780); $\nu_{max}(CHCl_3)/cm^{-1}$ 1726 (C=O); δ_H (60 MHz; CDCl₃) 1.13 (3 H, t, J 7.0, CH_2CH_3), 1.40 (3 H, s, OAc), 1.67–2.37 [6 H, m, (CH₂)₃], 2.58 (1 H, d, J 12, 4-H), 3.75 (1 H, d, J 12, 4-H), 4.07 (2 H, q, J 7.0, OCH_2CH_3) and 6.90–7.53 (10 H, m, 2 × Ph); δ_C (22.5 MHz; CDCl₃) 172.26 (C=O), 168.97 (C=O), 147.29 (=C<), 147.10 (=C<), 128.35 (=CH-), 128.08 (=CH-), 126.48 (=CH-), 126.38 (=CH-), 125.38 (=CH-), 124.48 (=CH-), 118.77 (1-C), 90.58 (3-C), 64.14 (5-C), 60.14 (OCH₂CH₃), 45.84 (>CH₂), 35.59 (>CH₂), 34.89 (>CH₂), 22.81 (>CH₂), 21.06 (COCH₃) and 14.02 (CH₂CH₃); m/z 394 (M⁺, 38%), 335 (36), 334 (100), 288 (35) and 257 (60).

Diethyl 2,2'-dioxobicyclopentyl-1,1'-dicarboxylate **9**. M.p. 53–54 °C (from hexane) (Found: C, 62.1; H, 7.25. Calc. for $C_{16}H_{22}O_6$: C, 61.92; H, 7.15%); $\nu_{max}(CHCl_3)/cm^{-1}$ 1726 (C=O); δ_H (60 MHz; CDCl₃) 1.37 (6 H, t, J 7.0, 2 × CH₂CH₃), 1.63–3.13 [12 H, m, 2 × (CH₂)₃] and 4.33 (4 H, q, J 7.0, 2 × OCH₂CH₃).

Ethyl 1-hydroxy-4,4-diphenyl-2,3-dioxabicyclo [4.4.0] decane-6-carboxylate 3ai. M.p. 128 °C (from ethanol) (Found: C, 72.1; H, 6.85. Calc. for $C_{23}H_{26}O_5$: C, 72.23; H, 6.85%); $\nu_{max}(CHCl_3)/cm^{-1}$ 3364 (OH) and 1719 (C=O); δ_{H} (60 MHz; CDCl₃) 1.03 (3 H, t, J 7.0, CH_2CH_3), 1.33–2.33 [8 H, m, $(CH_2)_4$], 2.70 (1 H, d, J 12, 5-H), 3.20 (1 H, d, J 12, 5-H), 3.80 (2 H, q, J 7.0, OCH_2CH_3), 6.73 (1 H, s, OH) and 6.97–7.66 (10 H, m, 2 × Ph).

Diethyl 2,2'-dioxobicyclohexyl-1,1'-dicarboxylate 10. M.p. 106–107 °C (from benzene–hexane) (Found: m/z 338.1736. Calc. for C₁₈H₂₆O₆: M, 338.1729); ν_{max} (CHCl₃)/cm⁻¹ 1729 (C=O); δ_{H} (60 MHz; CDCl₃) 1.33 (6 H, t, J 7.0, 2 × CH₂CH₃), 1.50–3.00 [16 H, m, 2 × (CH₂)₄] and 4.27 (4 H, q, J 7.0, 2 × OCH₂CH₃); m/z 338 (M⁺, 9%), 292 (18), 247 (32), 219 (32), 191 (25), 170 (100) and 124 (39).

Methylation of Ethyl cis-3-Hydroxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylate 3aa.—Camphor-10-sulfonic acid (668 mg) was added to a solution of 3aa (186 mg) dissolved in methanol (5 cm³) and the mixture was heated at 50 °C for 27 h. Saturated aqueous sodium hydrogen carbonate (10 cm³) was added to the reaction mixture which was then extracted with chloroform (30 cm³). The extract was separated, dried (Na₂SO₄) and evaporated. The residue was purified by TLC (Wakogel B10) with chloroform as the eluent to give a mixture of ethyl t-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane-r-4-carboxylate 11aa and ethyl c-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane-r-4-carboxylate 11aa' (179 mg, 92%) (molar ratio; 3:1).

Ethyl 3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane-4-carboxylates 11aa and 11aa'. M.p. 118–119 °C (from hexane) (Found: C, 70.5; H, 6.8. Calc. for $C_{21}H_{24}O_5$: C, 70.77; H, 6.79%); $\nu_{\text{max}}(\text{CHCl}_3)/\text{cm}^{-1}$ 1729 (C=O); $\delta_{\text{H}}(60 \text{ MHz}; \text{CDCl}_3)$ 1.27 (3 H, t, J 7.0, CH₂CH₃), 1.30 and 1.37 (3 H, s, s, Me), 2.63–3.10 (3 H, m, CH₂CH), 3.43 and 3.88 (3 H, s, s, OMe), 4.20 (2 H, q, J 7.0, OCH₂CH₃) and 7.23–7.73 (10 H, m, 2 × Ph); $\delta_{\text{C}}(22.5 \text{ MHz}; \text{CDCl}_3)$ 170.61 (C=O), 143.67 (=C<), 141.15 (=C<), 128.41 (=CH–), 128.29 (=CH–), 128.20 (=CH–), 127.93 (=CH–), 127.68 (=CH–), 127.29 (=CH–), 127.05 (=CH–), 126.32 (=CH–), 126.24 (=CH–), 125.93 (=CH–), 101.32 (3-C), 85.50 (6-C), 60.83 (OCH₂CH₃), 50.00 and 49.21 (OMe), 46.255 (4-C), 34.37 and 31.15 (5-C), 19.42 (CH₂CH₃), 15.53 and 14.14 (Me).

Reactions of 11aa and 11aa' with Grignard Reagents.—An ethereal solution of 11aa and 11aa' was added dropwise to a stirred solution of a Grignard reagent (MeMgI or PhMgBr) in dry diethyl ether (3 cm³) at 35 °C under an atmosphere of argon for 30 min. The mixture was stirred under reflux for 2 h. The reaction mixture was treated with aqueous ammonium chloride and ether. The ether layer was separated and the aqueous layer was extracted with ether several times. The combined ether extracts were washed with water, dried (MgSO₄) and evaporated. The residue was purified by TLC (Wakogel B10) eluting with a mixture of ether-hexane (1:9, v/v).

4-(1-Hydroxy-1-methylethyl)-3-methoxy-3-methyl-6,6-diphenyl-1,2-dioxane 12. Liquid (34%) (Found: m/z 342.1830. Calc. for C₂₁H₂₆O₄: M, 342.1831); $v_{\rm max}({\rm CHCl_3})/{\rm cm^{-1}}$ 3516 (OH); $\delta_{\rm H}(90~{\rm MHz};{\rm CDCl_3})$ 1.29 (3 H, s, Me), 1.34 (3 H, s, Me), 1.37 (3 H, s, Me), 1.95 (1 H, H_A) and 2.69 (2 H, H_B) (CH₂CH, AB₂ spin system, $J_{\rm AB}$ 7.8), 3.05 (1 H, s, OH), 3.45 (3 H, s, OMe) and 7.10–7.62 (10 H, m, 2 × Ph); $\delta_{\rm C}(22.5~{\rm MHz};{\rm CDCl_3})$ 144.59 (=C<), 142.09 (=C<), 128.35 (=CH-), 128.19 (=CH-), 127.65 (=CH-), 127.07 (=CH-), 127.01 (=CH-), 126.01 (=CH-), 104.44 (3-C), 85.85 (6-C), 71.52 (CMe_2OH), 48.89 (-OMe), 48.41 (4-C), 31.97 (Me), 31.45 (5-C), 28.52 (Me) and 22.42 (Me).

4-(*Hydroxydiphenylmethyl*)-3-*methoxy*-3-*methyl*-6,6-*diphenyl*-1,2-*dioxane* 13. Colourless needles (33%; from methanol), m.p. 171–172 °C [Found: m/z 489.2041 (M⁺ + Na). Calc. for C₃₁H₃₀NaO₄: M, 489.2042]; ν_{max} (CHCl₃)/cm ¹ 3450 (OH); δ_H(90 MHz; CDCl₃) 0.57 (3 H, s, Me), 2.33–3.05 (3 H, m, CH₂CH), 3.45 (3 H, s, OMe), 5.25 (1 H, s, OH) and 6.9–7.7 (20 H, m, 4 × Ph); δ_C(22.5 MHz; CDCl₃) 151.438, 147.918, 146.217, 143.711, 141.742, 128.361, 128.301, 128.077, 128.003, 127.854, 127.466, 127.242, 127.108, 126.541, 126.466, 126.332, 125.720, 125.094, 105.119 (3-C), 86.935 (6-C), 78.208 (O-C), 48.910 (OMe), 46.449 (4-C), 30.830 (5-C) and 21.000 (Me); m/z 489 (M⁺ + Na, 10%), 329 (10), 299 (15), 251 (10), 183 (65) and 105 (100).

Decomposition of **3aa** with Perchloric Acid in Acetic Acid.—A mixture of **3aa** (0.1 mmol) and 60% perchloric acid (0.01 cm³) in acetic acid (10 cm³) was stirred at room temperature for 1 h. After dilution with water (10 cm³) the mixture was extracted with diethyl ether and the extract evaporated. The residue was

purified on a silica gel plate eluting with chloroform to give 7 in quantitative yield.

MM2 Calculations.—These were performed by Chem 3D Plus (Version 3.0) using standard measurements. By considering an anomeric effect for the 1,2-dioxan-3-ol ring, the conformations, which might have the lowest energy, were calculated. The results were shown in Fig. 3.

Acknowledgements

We thank the Referees for their suggestions, particularly on the reaction mechanisms, and also thank Mr. Yasunori Sudo and the staff of the Taiho Pharmaceutical Co. Inc., Tokushima, Japan, for the measurements of high-resolution mass spectra.
