

η^3 -, η^4 - and η^6 -Co-ordination complexes of the weakly co-ordinating anion tetrakis[3,5-bis(trifluoromethyl)phenyl]borate

John Powell,* Alan Lough and Tahir Saeed

Department of Chemistry, University of Toronto, Toronto, Ontario, M5S 3H6, Canada

Single-crystal X-ray diffraction has established η^3 -, η^4 - and η^6 -co-ordination of the anion tetrakis[3,5-bis(trifluoromethyl)phenyl]borate (TFPB) in the complexes $\text{Ag}(\text{TFPB})(2,2'\text{-bipy})$ ($2,2'\text{-bipy} = 2,2'\text{-bipyridine}$), $\text{Ag}(\text{TFPB})(1,2\text{-C}_6\text{H}_4\text{I}_2)$ and $\text{Rh}(\text{TFPB})(\text{cod})$ ($\text{cod} = \text{cycloocta-1,5-diene}$) respectively.

Very weakly nucleophilic anions are of interest for a variety of applications which require the 'stabilization' of highly reactive cationic species.^{1,2} Particularly useful in this regard is the anion tetrakis[3,5-bis(trifluoromethyl)phenyl]borate (TFPB)^{3,4} and a recent example of its use is the isolation and structural characterization of *trans*-[Pt($\eta^1\text{-ClCH}_2\text{Cl}$)(PPR^i_3)](TFPB) containing the exceptionally weakly co-ordinating dichloromethane ligand.⁵ We here report the synthesis and structural characterization by single-crystal X-ray diffraction of two silver and one rhodium compound of the type $\text{M}\{\text{B}[3,5\text{-C}_6\text{H}_3(\text{CF}_3)_2]_4\}\text{L}_2$ which are the first examples of complexes in which the TFPB is co-ordinated to the metal.[†]

The silver complexes $\text{Ag}(\text{TFPB})\text{L}_2$ [$\text{L}_2 = 1,2\text{-C}_6\text{H}_4\text{I}_2$ **1**, $2,2'\text{-bipyridine}$ **2** ($2,2'\text{-bipy}$) and $1,2\text{-bis(diphenylphosphino)ethane}$ (dppe)] were readily obtained as white crystalline products according to equation (1).[‡]

[†] Crystal data for complex **1**. $\text{C}_{38}\text{H}_{52}\text{AgBF}_4\text{I}_2$, $M = 1300.99$, monoclinic, $a = 10.3372(11)$, $b = 17.8488(12)$, $c = 22.607(2)$ Å, $\beta = 94.214(8)^\circ$, $U = 4159.8(6)$ Å³, $T = 173(2)$ K, space group $P2_1/c$ (no. 14), graphite-monochromated Mo-K α radiation, $\lambda = 0.71071$ Å, $Z = 4$, $D_c = 2.077$ g cm⁻³, $F(000) = 2472$, colourless fragment with dimensions $0.46 \times 0.43 \times 0.38$, $\mu = 21.07$ cm⁻¹, no absorption correction; Siemens P4 diffractometer using ω scan mode, $2\theta = 52.00^\circ$, $h = -10$ to 12 , $k = -7$ to 22 , $l = -27$ to 27 , no intensity decay from three standards measured every 97 reflections; 8577 measured, 8111 unique ($R_{\text{int}} = 0.020$). The structure was solved and refined (on F^2 using all data with negative intensities included) using SHELXTL.⁶ All non-hydrogen atoms were refined anisotropically and hydrogen atoms were treated as riding atoms. The final weighting scheme was $w = 1/[\sigma^2(F_o^2) + (0.0592P)^2 + 1.27P]$ where $P = (F_o^2 + 2F_c^2)/3$. The final $R1[I > 2\sigma(I)] = 0.0343$ (for 6686 reflections) and $wR2$ (all data) = 0.0997 for 597 parameters, goodness of fit = 1.042. Maximum and minimum peaks in final Fourier-difference were 0.704 and -0.822 e Å⁻³.

Crystal data for complex **2**. $\text{C}_{42}\text{H}_{20}\text{AgBF}_4\text{N}_2 \cdot \text{CH}_2\text{Cl}_2$, $M = 1212.21$, monoclinic, $a = 12.3777(14)$, $b = 17.334(2)$, $c = 21.539(2)$ Å, $\beta = 97.695(9)^\circ$, $U = 4579.6(8)$ Å³, $T = 173(2)$ K, space group $P2_1/n$ (no. 14), graphite-monochromated Mo-K α radiation, $\lambda = 0.71071$ Å, $Z = 4$, $D_c = 1.758$ g cm⁻³, $F(000) = 2384$, colourless fragment with dimensions $0.43 \times 0.36 \times 0.28$, $\mu = 6.91$ cm⁻¹, absorption correction using ψ -scan data (minimum and maximum transmission 0.2570 and 0.9495); Siemens P4 diffractometer using ω -scan mode, $2\theta = 50.00^\circ$, $h = 0$ to 14 , $k = 0$ to 18 , $l = -25$ to 25 , no intensity decay from three standards measured every 97 reflections; 8264 measured, 7886 unique ($R_{\text{int}} = 0.026$). The structure was solved and refined (on F^2 using all data with negative intensities included) using SHELXTL.⁶ All non-hydrogen atoms were refined anisotropically and hydrogen atoms were treated as riding atoms. The final weighting scheme was $w = 1/[\sigma^2(F_o^2) + (0.0708P)^2 + 2.49P]$ where $P = (F_o^2 + 2F_c^2)/3$. The final $R1[I > 2\sigma(I)] = 0.0469$ (for 6028

The rhodium complex $\text{Rh}(\text{TFPB})(\text{cod})$ **3** ($\text{cod} = \text{cycloocta-1,5-diene}$) was similarly obtained from the reaction of $[\text{RhCl}(\text{cod})]_2$ with stoichiometric amounts of AgPF_6 and $\text{Na}[\text{TFPB}]$ in CH_2Cl_2 solution. The molecular structures of complexes **1–3** as determined by single-crystal X-ray diffraction, together with selected bond lengths are shown in Figs. 1–3. In the silver complexes **1** and **2** the TFPB ligand adopts bidentate bonding modes. In **1** two of the aryl rings are each η^2 -bonded to silver *via* the *ipso* carbon and an adjacent *ortho* carbon in a fairly symmetrical manner. The 1,2-diiodobenzene ligand also functions as a reasonably symmetrical bidentate ligand in contrast to the unsymmetrical bonding modes observed in $[\text{Ag}(1,2\text{-C}_6\text{H}_4\text{I}_2)_3]\text{PF}_6$ and $[\text{Ag}(\text{NO}_3)(1,2\text{-C}_6\text{H}_4\text{I}_2)]_n$.⁷ In the $2,2'\text{-bipyridine}$ complex **2** the TFPB ligand exhibits a less symmetrical η^3 -bonding mode comprised of an η^2 -interaction with an *ipso* and *ortho* carbon atom at one aromatic ring together with a weaker η^1 -interaction with the *ipso* carbon of a second aromatic ring. The Ag–C bond distances for the η^2 -interaction in **2** [2.424(3) and 2.493(3) Å] are significantly shorter than the corresponding distances in **1** [2.507(3)–2.686(3) Å]. The *ipso* carbon–silver distance of these η^2 -interactions is the shorter distance in **2** but the longer one in **1**. The change in co-ordination geometry of the TFPB ligand on going from **1** to **2** may well be a consequence of the increased steric requirements of the $2,2'\text{-bipyridine}$ ligand *vis-à-vis* the 1,2-diiodobenzene ligand. In this regard it is noteworthy that the single-crystal X-ray diffraction studies of the complex $\text{Ag}(\text{TFPB})(\text{dppe})$ have shown it to have the ionic structure $[\text{Ag}_2(\text{dppe})_2][\text{TFPB}]_2$.⁸ Presumably the steric size of the ligand now precludes co-

reflections) and $wR2$ (all data) = 0.1329 for 664 parameters, goodness of fit = 1.042. Maximum and minimum peaks in final Fourier-difference were 0.705 and -0.835 e Å⁻³. The F atoms of two CF_3 groups are disordered over two sites. The structure contains one disordered CH_2Cl_2 molecule.

Crystal data for complex **3**. $\text{C}_{40}\text{H}_{24}\text{BF}_4\text{Rh} \cdot 0.87\text{CH}_2\text{Cl}_2$, $M = 1148.11$, monoclinic, $a = 13.542(2)$, $b = 24.403(4)$, $c = 13.840(3)$ Å, $\beta = 90.06(1)^\circ$, $U = 4573.9(13)$ Å³, $T = 173(2)$ K, space group $P2_1/n$ (no. 14), graphite-monochromated Mo-K α radiation, $\lambda = 0.71071$ Å, $Z = 4$, $D_c = 1.667$ g cm⁻³, $F(000) = 2266$, colourless fragment with dimensions $0.23 \times 0.32 \times 0.34$, $\mu = 6.03$ cm⁻¹, absorption correction using ψ -scan data (minimum and maximum transmission 0.6418 and 0.9562); Siemens P4 diffractometer using ω -scan mode, $2\theta = 50.00^\circ$, $h = 0$ to 16 , $k = 0$ to 29 , $l = -16$ to 16 , no intensity decay from three standards measured every 97 reflections; 8264 measured, 7886 unique ($R_{\text{int}} = 0.026$). The structure was solved and refined (on F^2 using all data with negative intensities included) using SHELXTL.⁶ All non-hydrogen atoms were refined anisotropically and hydrogen atoms were treated as riding atoms. The final weighting scheme was $w = 1/[\sigma^2(F_o^2) + (0.0424P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$. The final $R1[I > 2\sigma(I)] = 0.0467$ (for 5725 reflections) and $wR2$ (all data) = 0.1315 for 652 parameters, goodness of fit = 0.959. Maximum and minimum peaks in final Fourier-difference were 0.902 and -0.868 e Å⁻³. The F atoms of one of the CF_3 groups are disordered over two sites. The structure contains a partial occupancy, disordered CH_2Cl_2 molecule. CCDC reference number 186/760.

[‡] Satisfactory elemental analyses were obtained for complexes **1** and **2** (Found for **1**: C, 34.85; H, 3.94; I, 19.84. Calc. for $\text{C}_{38}\text{H}_{52}\text{AgBF}_4\text{I}_2$: C, 35.08; H, 4.03; I, 19.51%. Found for **2**: C, 42.30; H, 1.67; N, 2.05. Calc. for $\text{C}_{42}\text{H}_{20}\text{AgBF}_4\text{N}_2 \cdot \text{CH}_2\text{Cl}_2$: C, 42.61; H, 1.83; N, 2.31%). Complex **3** was not very stable. Solutions of **3** in CH_2Cl_2 at 20 °C decomposed to unidentified products in a matter of hours.

ordination of the TFPB anion. In the rhodium complex **3** the TFPB co-ordinates *via* an η^6 -interaction with one of the aromatic rings in a manner that is similar to that observed in several $\eta^6\text{-BPh}_4$ rhodium complexes.⁹

These studies indicate that the very poor co-ordinating property of the TFPB anion is primarily steric in origin and that
