Carbon-Carbon Bond Formation by Cross Coupling of Enol Phosphates or Enol Triflates with Organomanganese Compounds

Keigo FUGAMI, Koichiro OSHIMA,<sup>\*</sup> and Kiitiro UTIMOTO Department of Industrial Chemistry, Faculty of Engineering, Kyoto University, Sakyo-ku, Kyoto 606

Trialkylmanganese-mediated alkylation of enol phosphates is performed in the presence of a catalytic amount of  $Pd(PPh_3)_4$ . The cross coupling reaction catalyzed by  $Li_2MnCl_4$  between enol triflates and Grignard reagents is also described.

Organoaluminium compounds react with enol phosphates to give alkylative coupling products in the presence of a catalytic amount of Pd(0).<sup>1</sup>) The process provides a method of converting ketones into alkyl-substituted olefins regioselectively.<sup>2</sup>) Here we wish to report that trialkylmanganate, R<sub>3</sub>MnM (M = Li or MgBr), is also effective for alkylation of enol phosphates or enol triflates.<sup>3</sup>)

An ethereal solution of PhLi (1.5 M, 1 M = 1 mol dm<sup>-3</sup>, 4.0 ml, 6.0 mmol) was added to a solution of  $\text{Li}_2\text{MnCl}_4$  (2.0 mmol) in THF under an argon atmosphere at 0 °C. After stirring for 15 min, a solution of enol phosphate **la** (0.32 g, 1.0 mmol) and Pd(PPh\_3)\_4 (0.11 g, 0.1 mmol) were added to the solution of triphenylmanganese compound, Ph\_3MnLi.<sup>4,5</sup>) The whole was heated at reflux for 2 h. The mixture was diluted with hexane and saturated aqueous NH<sub>4</sub>Cl (0.5 ml) was added. The resulting precipitate was filtered and the filtrate was dried and concentrated in vacuo. The residual oil was submitted to silica-gel column chromatography to give 1-phenyl-1-cyclododecene (0.20 g, 82% yield).

The results of the reaction between enol phosphates or enol triflates with  $R_3MnM$  are summarized in Table 1. Several comments are worth noting. (1) The reaction of enol phosphates with  $R_3MnM$  required the coexistence of Pd(0) catalyst and heating of the reaction mixture was essential for the completion of the reaction. On the other hand, alkylation of enol triflates with  $R_3MnM$  proceeded smoothly at room temperature without any catalysts. (2) In general,

Table 1. Cross coupling reactions between enol phosphates or enol triflates with  $R_{\rm 3}MnM$

a)  $R_3MnM$  (2.0 mmol), enol phosphate (1.0 mmol), and Pd(PPh<sub>3</sub>)<sub>4</sub> (0.1 mmol) were employed. The reaction mixture was heated at reflux for 2 h. b) A mixture of  $R_3MnM$  (3.0 mmol) and enol triflate (1.0 mmol) was stirred at 25 °C for 1 h.

the reagents  $R_3MnLi$  derived from  $Li_2MnCl_4$  and alkyllithium were superior to the reagents  $R_3MnMgX$  generated from Grignard compounds. For instance, treatment of enol triflate,  $CH_2=C(OSO_2CF_3)-n-C_{10}H_{21}$  (1b) with Me\_3MnMgI gave the desired 2-methyl-1-dodecene in only 30% yield along with the recovered starting material (50%) under the same reaction conditions as entry 7 in Table 1. (3) Lithium tri-n-butylmanganate was considerably less effective as cross coupling reagents than the trimethyl analog. The formation of the byproducts such as reduced alkene 3 (replacement of  $OP(O)(OEt)_2$  or  $OSO_2CF_3$  by H) and symmetrical coupling product 4 was observed. The former byproduct might be derived from the reaction of enol phosphates or enol triflates with H<sub>3</sub>MnM (or R<sub>2</sub>HMnM, RH<sub>2</sub>MnM) generated in situ by the decomposition of R<sub>3</sub>MnM (R = n-Bu).

The amount of  $\text{Li}_2\text{MnCl}_4$  could be reduced to a catalytic amount in the case of the reaction between enol triflates and Grignard reagents. The results are summarized in Table 2. The use of Grignard reagent was essential for the

a) Grignard reagent (3.0 mmol) was added to a solution of enol triflate (1.0 mmol) in the presence of  $\text{Li}_2\text{MnCl}_4$  (0.1 mmol) at 0 °C and the resulting mixture was stirred at 25 °C. b) Starting material (63%) was recovered. c) Starting material (26%) was recovered. d) See Ref. 6. e) A mixture of (2E)-5-pentyl-2,5-undecadiene and 3-methyl-4-pentyl-1,4-decadiene (1:1) was obtained.

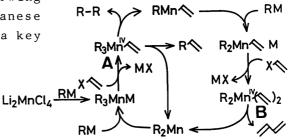

successful reaction. The reaction of enol triflate **lb** with methyllithium in the presence of Mn catalyst gave 2-dodecanone upon workup because the RLi caused nucleophilic attack on sulfur atom. The reaction proceeded well only with certain organomagnesium reagents such as PhMgBr, PhCH<sub>2</sub>MgCl, and allylmagnesium bromide.<sup>7</sup>)

- 7) We are tempted to assume the following reaction mechanism. Trialkylmanganese reacts with enol triflate to give a key intermediate Mn(IV) species A.<sup>8</sup>) The reductive elimination of alkyl and alkenyl groups provides the cross coupling product and dialkylmanganese R<sub>2</sub>Mn. The addition of RM to R<sub>2</sub>Mn regenerates

 $R_3MnM$ . Meanwhile, the formation of the byproduct, diene 7 presumably is explained by the reductive elimination of R-R from **A** to give alkylalkenylmanganese(II) compound and subsequent generation of another Mn(IV) species **B** followed by the reductive elimination of two alkenyl groups.

8) The formation of Mn(IV) species has been proposed in the symmetrical coupling of iodoalkenes to dienes on treatment with organolithium in the presence of Mn(II) salt. G. Cahiez, D. Bernard, and J. F. Normant, J. Organomet. Chem., <u>113</u>, 99 (1976).
