carbon tetrachloride, differs from that previously calculated for the model trans-decahydroisoquinolin-4 α -ol equilibrium (74:26) in tetrachloroethylene.⁸ (This compound reacted with carbon tetrachloride.) Since the solvent difference should presumably not be a factor, this discrepancy may be due to a maximum experimental error that reflects a 3–5 mol % probable error in the experimental values of the various conformer percentages. We favor the present assignments, however, due to the internal consistency of these

- results. For comparison, values of 53% **9d** and 10% **9c** have been reported by S. Vasickova, A. Vitek, and M. Tichy, *Collect. Czech. Chem. Commun.*, **38**, 1791 (1973), based upon other model systems.

Application of a Modification of the Polonovski Reaction to the Synthesis of Vinblastine-Type Alkaloids

Nicole Langlois, Francoise Guéritte, Yves Langlois, and Pierre Potier*

Contribution from the Institut de Chimie des Substances Naturelles, Centre National de la Recherche Scientifique, 91190 Gif-sur-Yvette, France. Received April 26, 1976

Abstract: A new C(16)-C(21) skeletal fragmentation of ibogane derivatives, induced by the modified Polonovski reaction, leads in the presence of aspidospermane derivatives to vinblastine-type compounds with the natural C(16') configuration, which seems necessary for significant antitumor activity. This new method of coupling, which could be the same as the biogenetical pathway, has been and will be applied to partial synthesis of naturally occurring antitumor alkaloids of *Catharanthus* roseus. The circular dichroism technique is of high diagnostic value for this series of compounds to distinguish between the natural or unnatural C(16') configurations. Another type of skeletal fragmentation at C(5)-C(6), also encountered during this study, was minimized under the experimental conditions.

Several antitumor alkaloids have been isolated from Ca-tharanthus roseus, ¹ including vinblastine² (1a), vincristine² (1b), leurosidine³ (1c), and leurosine³ (1d), and two of them, 1a and 1b, are widely used in cancer chemotherapy.

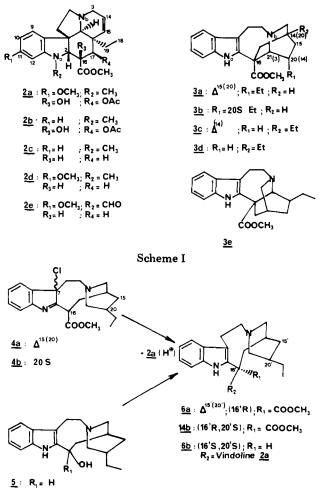

Unfortunately these compounds are present at very low concentrations in the plant material and their isolation is long, costly, and fraught with difficulty. For these reasons, their synthesis (partial or total) has been the subject of a considerable amount of work in the past ten years.⁴⁻¹²

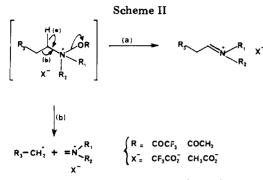

All these attempts were unsuccessful and led to compounds having "unnatural" configuration at C(16') and consequently, biologically inactive. Therefore, we recently¹³ introduced a new method based on a modification of the Polonovski reaction,¹⁴ which was afterwards¹⁵ adopted by other workers.¹⁶

The procedures used by our predecessors^{7,9,10,12} consisted of condensing vindoline (2a) or one of its derivatives with compounds having the *tetracyclic* ibogane skeleton, 4 or 5, obtained by cleavage¹⁷ of the C(16)-C(21)¹⁸ bond of catharanthine (3a) (Scheme I) or by total synthesis.^{5b,5c}

However, a plausible biogenetic hypothesis¹⁰ proposes that the vinblastine-type alkaloids could well be formed in nature by direct coupling of vindoline (**2a**) with catharanthine (*pentacyclic* ibogane skeleton) (**3a**), major alkaloidal components of *C. roseus*. This hypothesis has been verified¹⁹ in vivo; coupling of the two "monomeric" units could take place with concomitant breaking of the C(16)-C(21) bond of catharanthine (**3a**).

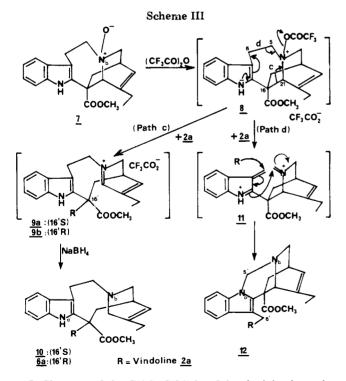

It is known that the Polonovski reaction²⁰—action of an acid anhydride on an *N*-oxide—can give rise both to elimination (path a) or fragmentation reactions (path b),²¹ as shown in Scheme II.

Preference for one or the other pathway is governed by electronic factors (nucleophilicity of X⁻, nature of the leaving group RO⁻) and steric factors (antiparallelism of C-C and $> N^+-O^-$ bonds).²²

In the past ten years, we have found many applications for this reaction; for example, in the preparation of a versatile Mannich reagent,²³ the synthesis²⁴ and partial synthesis²⁵ of natural products. The partial synthesis of vinblastine-type alkaloids¹³ constitutes one of the recent important developments of this reaction.

The rigid conformation of *pentacyclic* ibogane-type alkaloids (i.e., **3a**) lends itself to fragmentation reactions, since the bonds C(16)-C(21) and C(5)-C(6) are antiparallel with respect to the $> N^+-O^-$ bond of the corresponding N-oxides of these alkaloids; they are therefore susceptible to cleavage induced by suitable reagents such as trifluoroacetic anhydride.²¹ The formation of only one N-oxide is observed for catharanthine (**3a**) or its immediate derivatives. After treating the N-oxide (**7**) (a compound which is itself not stable and readily undergoes a facile skeletal rearrangement²⁶) with trifluoroacetic anhydride in the presence of vindoline (**2a**), two sorts of fragmentation are observed, as shown in Scheme III.

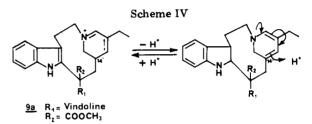

I. Cleavage of the C(16)-C(21) bond (path c) leads to the compound 10 (16'S) or anhydrovinblastine (yield 50%) and its 16'R epimer 6a, after direct reduction of the corresponding immoniums 9a and 9b in the reaction medium. The relative

amounts of these two compounds and the total yields vary with the concentrations used (see Experimental Section). This, along with an inspection of the molecular models, leads one to assume that compound **10** ("natural" configuration) would be the result of a concerted reaction and **6a** the result of a stepwise reaction. For the latter case, the assumed intermediate could well be analogous to that obtained from coupling reactions using derivatives such as **4** or **5**.¹²

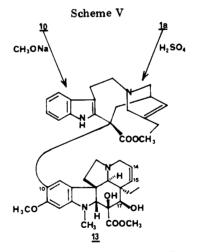

The nature of the junction between the two monomers was elucidated from ¹H NMR studies (240 MHz):²⁷ the protons C(12)-H and C(9)-H appear as singlets for **10** and **6a**, showing that the vindoline part is substituted at C(10); also, a comparison of the chemical shifts of C(9)-H, C(12)-H, and C(18)-H of **10**, vinblastine (**1a**), leurosidine (**1c**), and leurosine (**1d**) show that there is a strong similarity between these compounds. Finally, the absence of signals between 4 and 5 ppm eliminates the possibility of a junction α to N_{b'} of the ibogane moiety.

To exclude the possibility of isomerization at C(14') through an ene-immonium **9a**-dieneamine equilibrium (Scheme IV),

a correlation between 10 and vinblastine (1a) has been carried out.

Treatment of vinblastine (1a) by H_2SO_4 at 0 °C gives, among other products (see Experimental Section) a dehydrated ($\Delta^{15'(20')}$) and C(17) deacetylated product 13, which is identical with the product obtained by deacetylation of 10 at C(17) (Scheme V).

Finally, compound **6a** ("unnatural" configuration 16'R) proved to be identical with the compound obtained¹⁰⁻¹² by coupling the chloroindolenine (**4a**) with vindoline (**2a**) (Scheme I).

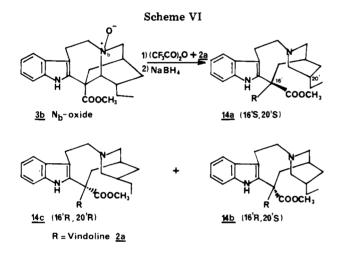

The coupling reaction of 15,20S-dihydrocatharanthine (3b) (as the Nb oxide) with vindoline (2a) gives, through the same type of cleavage reaction (path c, Scheme III) three compounds having the same planar structure. These are 14a (16'S,20'S) and the two compounds 14b (16'R,20'S) and 14c (16'R,20'R) (Scheme VI).

Because of the similarities between the spectral properties of "deoxy vinblastine B" and isoleurosine (20' epimers),⁷ compound **14a** was converted to the corresponding hydrazide, whose optical rotation show it to be a compound of configu-

Journal of the American Chemical Society / 98:22 / October 27, 1976

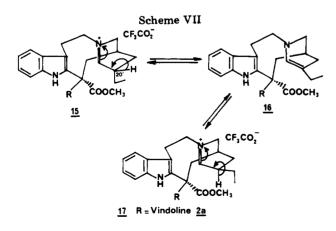

Substrates	Products

^a Previously treated by p-NO₂C₆H₄CO₃H. ^b Coupling temperature -78 °C. ^c Coupling temperature 0 °C. ^d Attributed configuration 16'S. ^e Attributed configuration 16'R.

ration 20'S. This result was also confirmed by direct comparison of compound **14a** with an authentic sample of "deoxy vinblastine B".⁷

Also 14b is identical with the coupling product of the chloroindolenine of 15,20S-dihydro-16S-carbomethoxycleavamine $(4b)^{28}$ with vindoline (2a) (Scheme I). Configurations of 14b and 14c are therefore determined. Isomerization at C(20) of 14b and 14c is explained through the equilibrium immoniums 15 (17)-enamine 16; reprotonation, followed by reduction, can lead either to the isomer 20'S 14b or 20'R 14c (Scheme VII).

The compound having the configurations 16'S, 20'R was not obtained from our experiments.

The ene-immonium **9a** (Scheme III), when treated with sodium cyanoborohydride in an acid medium also gives **14a**, undoubtedly by a 1,4-reduction of the dihydropyridine system, giving an intermediate enamine which reprotonates and undergoes further reduction.

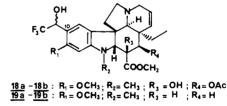

Finally, compound 10 (Scheme III) can be reduced regioand stereospecifically to 14a, the Δ^{14} bond of the vindoline moiety being unaffected under the conditions used.

II. Cleavage of the C(5)–C(6) bond (path d, Scheme III) leads to products such as $12,^{29}$ a minor product in the reaction conditions (CH₂Cl₂, (CF₃CO)₂O, -78 °C).

However, this type of fragmentation, the reverse of a previously observed example,³⁰ becomes predominant as the nucleophilicity of R increased ($R = X^- = CH_3CO_2^-$, OH⁻).²⁹

Similar compounds **20**, **23**, **24d**, and **28** are obtained from the coupling of various aspidospermane-ibogane alkaloids or derivatives (Table I).

These coupling reactions are accompanied by a side reaction due to the nucleophilic character of C(10) of aspidospermane alkaloids with respect to the CF_3CO^+ ion. For example, in the case of vindoline (2a), the two epimeric alcohols 18a and 18b

are obtained after reduction of the reaction mixture with sodium borohydride.

Use of a "Polonovski-type" cleavage reaction for the partial syntheses of vinblastine-type alkaloids makes many compounds having the "natural" configuration at C(16') readily accessible starting from aspidospermane and ibogane alkaloids or derivatives. Thus, one can vary independently the different functionalities in the alkaloids before coupling them to produce new "dimers" for biological evaluation. This enables studies of the structure-activity relationship for this important group of compounds, in particular the study of their interaction with tubuline. For these reasons, a number of condensations have been carried out starting with various aspidospermane and ibogane alkaloids and derivatives. The results obtained are shown in Table I.

With reference to Table I several comments are in order. For the ibogane alkaloids or derivatives one notices that those

which contain a double bond in the isoquinuclidine part, i.e., catharanthine (3a) and allocatharanthine (3c),⁴¹ give better yields of the coupled products than their saturated analogues (dihydrocatharanthine (3b) and dihydroallocatharanthine (3d)), the cleavage reaction between C(16-C(21) being favored by the presence of the double bond.

Similarly, we have varied the nucleophilic character of the aspidospermane moiety. In every case, vindoline (2a) gives the best results in the coupling reaction. The presence of the basic nitrogen N_a seems necessary: N_a -formyl-2,16-dihydro-11-methoxytabersonine (2e) does not undergo any coupling reaction. On the other hand, the influence of an oxygen atom on C(11) seems less marked¹¹ (as in the case of N_a -methyl-2,16-dihydrotabersonine (2c) and N_a -methyl-2,16-dihydro-11-methoxytabersonine (2d)). It is worthy to note that, rather unexpectedly, vindorosine (2b) yielded only one "dimer" 25 having "unnatural" 16'R configuration.

As we have already pointed out, for the first time, 13,15b circular dichroism allows a ready distinction to be made between the 16'S compounds and their "unnatural" epimers 16'R (Table II). This diagnostic tool was also subsequently used by others.³¹ There is a good agreement between the values obtained from vinblastine (1a) and the compounds 16'S on one hand and the compounds 16'R on the other hand. Coronaridine (3e) is enantiomeric to dihydrocatharanthine (3b);³² CD curves of coupling compounds 24a and 24b (coronaridine (3e)-vindoline (2a)) imply that the configuration of these compounds may be 16'S.

Conclusion

The modified Polonovski reaction, discovered in our laboratory and applied to the N-oxides of ibogane alkaloids or derivatives, gives, principally, in the presence of a sufficiently nucleophilic alkaloidal counterpart, coupling products of the vinblastine type, of which one epimer has the "natural" configuration at C(16'). This method allows access to this type of highly active biological compounds by partial synthesis for the first time. Partial synthesis of antitumor alkaloid has been developed in our laboratory.³³

The results obtained in these studies enable us to reach original structures having interesting pharmacological activities.

Experimental Section

Melting points were taken on a Kofler apparatus, optical rotations measured (CHCl₃ solution, g/100 ml) on a Perkin-Elmer 141 MC, infrared spectra (ν cm⁻¹, CHCl₃) on a Perkin-Elmer 257, ultraviolet spectra [EtOH, λ_{max} , nm (ϵ)] on a Bausch and Lomb Spectronic 505, CD curves [EtOH, λ_{max} , nm (ϵ)] on a Roussel-Jouan Dichrograph II. ¹H NMR spectra were obtained (CDCl₃, Me₄Si, $\delta = 0$ ppm) from Varian T 60 or IEF 240²⁷ spectrometers (coupling constants, J, are given in hertz; s, d, t, dd, and m indicate singlet, doublet, triplet, doublet of doublet, and multiplet, respectively). Mass spectra were measured on an AEI MS 9. Preparative layer chromatography (preparative TLC) is performed with Kieselgel HF 254 + 366 Merck.

Catharanthine *N***-Oxide** (7). *p*-Nitroperbenzoic acid (490 mg, 2.68 mmol, 98%) in 62 ml of CH₂Cl₂ was added at 0 °C to a stirred solution of 600 mg (1.79 mmol) of catharanthine (**3a**) in 18 ml of CH₂Cl₂. After 5 min, the reaction mixture was poured into 50 ml of a 10% aqueous solution of Na₂CO₃. Usual workup followed by evaporation below 40 °C gives catharanthine *N*-oxide in a quantitative yield: uv 277, 284, 293 nm; ¹H NMR (60 MHz) δ 8.06 (1 H, N_a-H); 7.6-7.0 (4 H, aromatic); 6.13 (br d, 1 H, $J \sim 7$ Hz, C(15)-H); 4.73 (br s, 1 H, C(21-H), 3.73 (s, 3 H, CO₂CH₃), 1.12 (t, 3 H, J = 7 Hz, C(18)-H); MS *m/e* 352 (100%, M·⁺), 336, 335, 293, 254, 248, 222, 204, 144, 143. This spectrum is not that expected for catharanthine *N*-oxide, but rather that of its rearranged product.²⁶

Coupling of Catharanthine *N***-Oxide** (7) with Vindoline (2a). Trifluoroacetic anhydride (0.115 ml, 0.8 mmol) was added to a stirred solution of catharanthine *N*-oxide (7) (100 mg, 0.3 mmol) and vindoline³⁴ (2a) (135 mg, 0.3 mmol) in dry CH₂Cl₂ (0.83 ml) under N₂ at -78 °C. After 30 min, excess solvent and trifluoroacetic anhydride were distilled off in vacuo at 20 °C. The residue was dissolved in MeOH (5.7 ml) and excess NaBH₄ was added at 0 °C; after 15 min, the reaction mixture was poured into H₂O (100 ml) and extracted with CHCl₃. Preparative TLC (AcOEt-MeOH 96:4) of the residue (230 mg) afforded 10 (114 mg, 50%), 6a (29 mg, 12%), and a mixture of 12 (9 mg, 4%) and vindoline (2a), which was separated by a second preparative TLC (AcOEt). This crucial experiment was carried out under various experimental conditions (see Table III).

Dehydration (and Deacetylation) of Vinblastine (VLB). Vinblastine sulfate (160 mg) was added with stirring under N₂ to 4 ml of concentrated H₂SO₄ at 0 °C; after 130 min, excess concentrated NH₄OH was added at 0 °C and extraction with CHCl₃ afforded a mixture which was separated by preparative alkaline TLC (ether-cyclohexane-MeOH 100:8:15) and gave 13 (17 mg) and $\Delta^{19'}$ -deacetyl 14a (22 mg), E + Z isomers.

Deacetyl anhydro VLB 13 (from VLB): $[\alpha] D 88 \pm 4^{\circ}$ (c = 1.09); ir 3460 (NH, chelated OH), 1730 (esters), 1620 cm⁻¹ (indoline); uv 217 (35 500), 268 (11 700), 290 (9300), 299 nm (8400); CD 260 (12.0), 304 (4.8); ¹H NMR 9.41 (1 H, C(16)–OH), 7.89 (1 H, N_{a'} –H), 7.41 (1 H, aromatic), 7.2–6.9 (3 H, aromatic), 6.50 and 6.02 (s, 1 H, C(9)–H and C(12)–H), 5.76 (dd, $J_{14,15} = 9.5$ and $J_{3,14} \sim 3.5$ Hz, C(14)–H), 5.66 (br d, J = 9.5 Hz, C(15)–H), 5.38 (1 H, C(15')–H), 4.03 (C(17)–H), 3.80 (s), 3.76 and 3.56 (s, C(11)–OCH₃, C(16)– CO₂CH₃, and C(16')–CO₂CH₃), 2.72 (s, 3 H, N_a–CH₃), absence of acetyl group, 1.90 (C(19')–H), 1.68 (C(19)–H), 0.97 (t, $J_{18',19'} = 7$ Hz, C(18')–H), 0.93 (t, $J_{18,19} = 6.8$ Hz, C(18)–H); MS *m/e* 750 (M.⁺), 691, 633, 553, 427, 336, 265, 240, 188, 144, 136, 135, 122, 121 (100%), 108, 107, 106.

 $\Delta^{19'}$ -Deacetyl 14a (E + Z isomers) (a = major product, b = minor product: uv 217, 269, 289, 298, sh 318 nm; CD 16'S configuration; ¹H NMR δ 9.40 (1 H, C(16)–OH), 7.84 (1 H, N_{a'}-H), 7.37 (1 H, aromatic), 7.1–6.9 (3 H, aromatic), 6.46 and 6.00 (s, 1 H, C(9)–H and C(12)–H), 5.72 (dd, $J_{14,15} = 10$ and $J_{3,14} = 3$ Hz, C(14)–H), 5.64 (d, J = 10 Hz, C(15)–H), 5.38 (q, $J_{18',19'} = 6$ Hz, C(19')–H of a), 5.18 (q, $J \sim 7$ Hz, C(19')–H of b), 4.01 (C(17)–H), 3.78 (s), 3.74 and 3.53 (s, C(11)–OCH₃, C(16)–CO₂CH₃, and C(16')–CO₂CH₃), 2.71 (s, N_a–CH₃), 1.70 (d, $J \sim 7$ Hz, C(18')–H of b), 1.65 (d, J = 6 Hz, C(18')–H of a), 0.91 (t, $J \sim 6.5$ Hz, C(18)–H); MS *m/e* 750 (M·⁺), 692, 691, 633, 427, 265, 240, 136 (100%), 135, 122, 121 (100%), 108, 107.

Deacetyl Anhydro VLB 13 from 10. A solution of 10 (18 mg, 0.02 mmol) in MeOH (2 ml) was added with stirring to a solution of sodium methoxide (Na, 54 mg; MeOH, 2 ml). After 90 min at room temperature, the reaction mixture was poured into brine; usual workup afforded 13, (14 mg, 80%) identical in all respects with compound 13 obtained from VLB.

15,20*S***-Dihydrocatharanthine** *N***-Oxide** (**3b** *N***-Oxide**). 15,20*S*-Dihydrocatharanthine (**3b**)^{17a} (464 mg, 1.37 mmol) treated by *p*-nitroperbenzoic acid (1.65 mmol) in the same experimental conditions

as described for catharanthine (**3a**) (see above) afforded the corresponding *N*-oxide in quantitative yield: uv 277, 284, 293 nm; ¹H NMR δ 8.0 (1 H, N_a-H), 7.2-7.0 (4 H, aromatic), 4.23 (1 H, C(21)-H), 3.70 (s, 3 H, C(16)-CO₂CH₃); MS *m/e* 354 (M⁺⁺), 338 (100%), 277, 214, 169, 144, 124, 120.

Coupling of 15,20S-Dihydrocatharanthine N-Oxide (3b N-Oxide) with Vindoline (2a). Trifluoroacetic anhydride (0.134 ml, 0.97 mmol) was added to a stirred solution of 3b N-oxide (120 mg, 0.34 mmol) and vindoline (2a) (162 mg, 0.35 mmol) in 1.0 ml of dichloromethane under argon at -78 °C. After 50 min, usual workup led to a residue which was purified by preparative TLC (AcOEt-EtOH 3:1), yielding 14a (26 mg, 10%) and 230 mg of a mixture of 14b, 14c, 20, and vindoline (2a), which was again purified by TLC (AcOEt-MeOH 92:8) to give 14b (55 mg, 19%), 14c (12 mg, 4%) and 120 mg of a mixture of 20 and vindoline (2a). This mixture purified by preparative TLC (Merck HF 254 + 366, AcOEt eluent, two successive elutions) gave 20 (24 mg, 9%) and vindoline (2a) (67 mg).

"Dimeric" compound 14a ("deoxy-VLB B"): mp 214 °C (methanol); [α]D 69° (c = 0.43); ir 1740, 1615 cm⁻¹; uv 216 (42 300), 263 (11 900), 290 (10 800), 297 (10 200); CD 255 (12.5), 302 (5.0); ¹H NMR δ 9.77 (1 H, C(16)–OH)), 7.83 (N_a/–H), 7.0 (aromatic), 6.49 and 6.02 (s, 1 H, C(9)–H and C(12)–H), 5.78 (dd, J_{14,15} = 9 and J_{3,14} ~ 4 Hz, C(14)–H), 5.36 (s, 1 H, C(17)–H), 5.23 (br d, J = 9 Hz, C(15)–H), 3.74 (s, 6 H) and 3.55 (s, 3 H, C(11)–OCH₃, C(16)– CO₂CH₃, and C(16')–CO₂CH₃), 2.67 (s, 3 H, N_a–CH₃), 2.08 (s, 3 H, OCOCH₃), 0.86 and 0.82 (2 superposed t, C(18')–H and C(18) –H); MS *m/e* 794.4234 (calcd 794.4254, C4₆H₅₈N₄O₈), 792, 763, 735, 635, 525, 510.2757 (calcd 510.2756, C₃₂H₃₆N₃O₃), 469, 338.1988 (calcd 338.1994, C₂₁H₂₆N₂O₂), 282.1332 (calcd 282.1341, C₁₄H₂₀NO₅), 138.1291 (calcd 138.1288, C9H₁₆N, 100%), 135, 124, 122, 121, 108, 107.

Hydrazide from 14a was prepared as described;⁷ this decarbomethoxy deacetyl compound was identical in all respects with an authentic sample: $[\alpha]D - 10^{\circ}$ (c = 0.70).

"Dimeric" compound 14b: $[\alpha]D - 26^{\circ}$ (c = 0.58); uv 216 (43 600), 264 (11 600), 290 (9900), 297 (10 300); CD 260 (-13.8), 282 (5.0), 307 (8.2); ¹H NMR δ 9.62 (1 H, C(16)-OH), 8.95 (N_a'-H), 7.4-7.0 (aromatic), 6.93 and 6.00 (s, 1 H, C(9)-H and C(12)-H), 5.90 (dd, 1 H, J_{14,15} = 9 and J_{3,14} ~ 4 Hz, C(14)-H), 5.38 (d, 1 H, J_{14,15} = 9 Hz, C(15)-H), 5.37 (s, 1 H, C(17)-H), 3.82 (s, 3 H) and 3.68 (s, 6 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃), 2.58 (s, 3 H, N_a-CH₃), 2.05 (s, 3 H, OCOCH₃), 0.91 (t, 3 H, J = 7.5 Hz), and 0.67 (t, 3 H, J = 7 Hz, C(18')-H and C(18)-H); MS *m/e* 794, 763, 735, 635, 469, 338, 282, 138 (100%), 135, 124, 122, 121.

Compound 14b is identical with the compound obtained¹² by coupling the chloroindolenine (4b) with vindoline (2a).

"Dimeric" compound 14c: $[\alpha]D - 53^{\circ}$ (c = 0.60); uv 216 (42 500), 264 (12 700), 290 (11 250), 298 nm (11 500); CD 259 (-11.8), 280 (3.2), 310 (5.85); ¹H NMR δ 8.83 (N_a-H), 7.2-6.9 (aromatic), 6.56 and 5.91 (s, 1 H, C(9)-H and C(12)-H), 5.85 (dd, J_{14,15} = 9 and J_{3,14} ~ 4 Hz, C(14)-H), 5.24 (1 H, d, J = 9 Hz, C(15)-H), 5.19 (s, 1 H, C(17)-H), 3.83, 3.68, and 3.66 (s, 3 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃, 2.60 (s, 3 H, N_a-CH₃), 2.04 (s, 3 H, OCOCH₃), 0.89 (t, 3 H, J = 7.5 Hz) and 0.63 (t, 3 H, $J \sim 7$ Hz, C(18')-H and C(18)-H); MS *m/e* 794 (M·+), 763, 735, 635, 469, 338, 282, 138 (100%), 135, 124, 122, 121.

"Dimeric" compound 20 (violet with CAS reagent): $[\alpha]D - 66^{\circ} (c$

= 0.58); ir 1740 (esters), 1620 cm⁻¹ (indoline); uv 216 (38 700), 226 (sh, 32 300), 256 (11 300), 288 (8900) and 297 nm (9500); acidic medium 216 (41 000), 257 (11 400), 285 (8200), 295 nm (8150); CD 253 (14.0), 304 (-3.2); ¹H NMR δ absence of N_a-H, 7.3-6.8 (aromatic), 6.33 and 5.98 (s, 1 H, C(9)-H and C(12)-H), 5.66 (dd, 1 H, $J_{14,15}$ = 9.5 and $J_{3,14} \sim 3$ Hz, C(14)-H), 5.20 (s, 1 H, C(17)-H), 5.08 (d, 1 H, J = 9.5 Hz, C(15)-H), 4.98 and 4.87 (2 d, 2 H, J_{AB} = 11.5 Hz, C(5')-H), 3.83, 3.74, and 3.47 (s, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃, 2.67 (s, 3 H, N_a-CH₃), 2.03 (s, OCOCH₃), 0.88 (t, 3 H, J = 7 Hz) and 0.09 (t, 3 H, J ~ 6 Hz, C(18')-H and C(18)-H); MS *m/e* 792.4075 (calcd 792.4098, C₄₆H₅₆N₄O₈, 100%, M⁺), 733.3917 (calcd 733.3965, C₄₄H₅₃N₄O₆), 732, 645, 633.3753 (calcd 633.3804, C₄₀H₄₉N₄O₃), 631, 552, 525, 511, 510.2747 (calcd 510.2756, C₃₂H₃₆N₃O₃), 497, 337, 308, 282, 200, 188, 174, 154, 135, 122, 121, 107.

Coupling of Catharanthine N-Oxide (7) with Vindoline (2a) Followed by Sodium Cyanoborohydride Reduction. The coupling reaction is carried out in the same experimental conditions as described above. After 30 min, methanol (0.8 ml) and an excess of sodium cyanoborohydride were added to the dichloromethane solution. After 15 min, usual workup led to a foamy residue purified by preparative TLC (AcOEt-MeOH 95:5), yielding 14a (23 mg, 10%) and 10 (40 mg, 17%).

Hydrogenation of Anhydro Vinblastine (10). Hydrogenation of 32 mg (0.04 mmol) of 10 in EtOH (PtO₂, 5 mg) for 15 h led to a quantitative yield of 14a; hydrazide⁷ $[\alpha]D - 8.6^{\circ}$ (c = 0.45).

Allocatharanthine *N*-oxide (3c *N*-oxide) is obtained from allocatharanthine³⁶ (3c) (125 mg, 0.37 mmol) in the usual way: *p*-nitroperbenzoic acid (102 mg, 0.56 mmol) in CH₂Cl₂ (16 ml), 3 min at 0 °C, quantitative yield: uv 275, 283, 292 nm; ¹H NMR (60 MHz) δ 7.9 (1 H, N_a-H), 7.7-7.0 (4 H, aromatic), 3.73 (s, 3 H, CO₂CH₃), 0.95 (t, 3 H, *J* = 7 Hz, C(18)-H); MS *m/e* 352 (M·⁺), 336, 334, 293, 167 (100%), 143.

Coupling of Allocatharanthine N-Oxide (3c N-Oxide) with Vindoline (2a). Trifluoroacetic anhydride (0.10 ml, 0.7 mmol) was added to a stirred solution of 3c N-oxide (85 mg, 0.24 mmol) and vindoline (2a) (114 mg, 0.25 mmol) in 0.7 ml of dry CH_2Cl_2 at 0 °C under argon. After 30 min the mixture was treated in the usual way. The residue (foam) purified by TLC (eluent CHCl₃-MeOH 95:5) yielded 21 (37 mg, 20%) and impure 18a (10 mg). Additional preparative TLC (AcOEt-MeOH 3:1) led to 18a (4 mg, 3% see further).

"Dimeric" compound 21: $[\alpha]D 0^{\circ} (c = 0.85)$; ir 1740, 1620, cm; uv 263 (13 300), 291 (8600), 298 nm (9000); CD 258 (7.9), 302 (0.18); ¹H NMR (60 MHz) δ 7.80-7.40 (2 H, C(16)-OH and N_{a'}-H); 7.4-7.0 (aromatic); 6.90 (s attributed to C(9)-H), 6.02 (s, 1 H, C(12)-H), 6.10-5.10 (4 H, ethylenic), 5.40 (s, 1 H, C(17)-H), 3.80, 3.58, and 3.50 (s, 3 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16') -CO₂CH₃), 2.68 (s, 3 H, N_a-CH₃), 2.08 (s, 3 H, OCOCH₃), 0.75-0.45 (2 t, 3 H, C(18)-H and C(18')-H); MS *m/e* 792, 763, 733, 631, 539, 469, 394, 379, 282, 135 (100%), 122, 121, 107.

14,15-Dihydroallocatharanthine *N*-Oxide (3d *N*-Oxide). *p*-Nitroperbenzoic acid (138 mg, 0.75 mmol) in CH₂Cl₂ (18.6 ml) was added to a stirred solution of 14,15-dihydroallocatharanthine³⁶ (3d) (210 mg, 0.62 mmol) in CH₂Cl₂ (6.2 ml at 0 °C). After 3 min the CH₂Cl₂ solution was treated as usual. The residue obtained was purified by preparative TLC (eluent CHCl₃-MeOH 90:10) and yielded 3d *N*-oxide (197 mg, 90%): uv 274, 283, 292 nm; ¹H NMR (60 MHz) δ 9.15 (1 H, N_a-H), 7.55-6.73 (4 H, aromatic), 3.73 (s, 3 H, CO₂CH₃), 0.81 (t, 3 H, *J* = 7 Hz, C(18)-H); MS *m/e* 354, 352, 338 (100%), 336, 277, 214, 208, 120.

Coupling of 14,15-Dihydroallocatharanthine N-Oxide (3d N-Oxide) with Vindoline (2a). Trifluoroacetic anhydride (0.10 ml, 0.7 mmol) was added to a stirred solution of 3d N-oxide (100 mg, 0.3 mmol) and vindoline (2a) (135 mg, 0.3 mmol) in 0.8 ml of dry dichloromethane at -78 °C under argon. After 50 min the mixture was treated as above. The residual foam purified by preparative TLC (eluent AcOEt-MeOH 97:3) led to 22 (26 mg, 11%) and a mixture of vindoline (2a) and 23, once again purified by preparative TLC (eluent AcOEt-MeOH 96:4), giving compound 23 (40 mg, 17%).

"Dimeric" compound 22: $[\alpha]D 13^{\circ}$ (c = 0.53); ir 1745, 1620 cm⁻¹; uv 214 (44 500); 259 (15 300), 288 (12 300), 297 nm (11 200), CD 259 (14.6), 305 (7.3); ¹H NMR δ 9.73 (s, 1 H, C(16)–OH), 7.92 (br s, 1 H, N_{a'}–H), 7.6–7.0 (aromatic), 6.84 (s, 1 H, C(9)–H), 6.04 (s, 1 H, C(12)–H), 5.88 (dd, 1 H, J_{14,15} = 9.6 and J_{3,14} = 3.5 Hz, C(14)–H), 5.47 (s, 1 H, C(17)–H), 5.34 (d, J = 9.6, C(15)–H), 3.91 (2 s, 6 H) and 3.69 (s, 3 H, C(11)–OCH₃, C(16)–CO₂CH₃, and C(16')-CO₂CH₃), 2.79 (s, 3 H, N_a-CH₃), 2.25 (s, 3 H, OCOCH₃), 0.92 (t, 3 H, J = 7.5) and 0.47 (3 H, attributed to C(18'-H and C(18)-H); MS *m/e* 794 (M·⁺), 763, 735, 664, 635, 469, 338, 282, 135, 124 (100%), 122.

"Dimeric" compound 23 (violet with CAS reagent): $[\alpha]D - 84^{\circ}$ (c = 0.59); ir 1740, 1620 cm⁻¹; uv 226 (sh, 38 000), 256 (10 200), 288 (7200), 297 nm (8000); CD 250 (12.0), 302 (-2.5); ¹H NMR δ absence of N_a'-H, 7.3-6.9 (4 H, aromatic), 6.51 and 6.10 (s, 1 H, C(9)-H and C(12)-H), 5.73 (dd, 1 H, $J_{14,15} = 11$ and $J_{3,14} = 5.5$ Hz, C(14)-H), 5.30 (s, 1 H, C(17)-H), 5.15 (dd, 1 H, J = 11 Hz, C(15)-H), 5.05 and 4.92 (2 d, 2 H, $J_{AB} = 12.5$ Hz, C(5')-H), 3.86, 3.76, and 3.58 (s, 3 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃), 2.67 (s, 3 H, N_a-CH₃), 2.03 (s, 3 H, OCOCH₃), 0.73 (t, 3 H, J = 7.2 Hz) and 0.0 (t, 3 H, $J \sim 7$ Hz, C(18')-H and C(18)-H; MS fragmentation identical with compound **20**, 792 (M⁺), 733, 645, 633, 631, 584, 552, 525, 511, 510, 497, 337, 308, 282, 202, 200, 188, 174, 154, 135 (100%), 122, 121, 107.

Coronaridine N-Oxide (3e N-Oxide). A solution of *p*-nitroperbenzoic acid (212 mg, 1.16 mmol) in dichloromethane (27 ml) was added to a stirred solution of coronaridine^{32,37} (3e) (261 mg, 0.77 mmol) in dichloromethane (7.8 ml). After 10 min at room temperature and usual workup, the resulting mixture was purified by preparative TLC: 3e N-oxide (234 mg, 86%) and 3e 7 ς -hydroxyindolenine N-oxide (40 mg, 14%).

3e *N***-oxide:** mp 208–210 °C dec; uv 225 (27 900), 285 (6300), 293 nm (5300); ¹H NMR (60 MHz) δ 8.05 (N_a-H), 7.6–7.1 (4 H, aromatic), 4.18 (C(21)-H and CH–N_b), 3.80 (s, 3 H, CO₂CH₃), 0.92 (t, 3 H, *J* = 7 Hz, C(18)–H); MS *m/e* 354 (M·+), 338 (100%), 323, 309, 277, 253, 214, 169, 154, 136, 124, 122.

3e 75-hydroxyindolenine *N*-oxide: mp 260 °C dec; uv: 226 (17 200), 232 (sh, 13 900), 273 nm (5100); ¹H NMR (60 MHz) δ absence of N_a-H, 7.7-7.2 (4 H, aromatic), 4.55 (C(21)-H), 3.74 (s, 3 H, CO₂CH₃), 0.84 (t, 3 H, *J* = 7 Hz, C(18)-H); MS *m/e* 370 (M⁺⁺), 354 (100%), 337, 295, 230, 188, 161, 160, 159, 138, 122.

Coupling of Coronaridine N-Oxide (3e N-Oxide) with Vindoline (2a). Trifluoroacetic anhydride (2 ml, 14.0 mmol) was added to a stirred solution of 3e N-oxide (177 mg, 0.5 mmol) and vindoline (2a) (251 mg, 0.6 mmol) in CH₂Cl₂ (15 ml) at 0 °C under nitrogen. After 60 min at room temperature the mixture was treated as usual and purified by preparative TLC (CHCl₃-MeOH 96:4), giving "dimeric" compound 24a (155 mg), an impure of three compounds (126 mg), trifluoroalcohol 18a (50 mg), and impure "dimer" 24d (90 mg). The mixture purified by preparative TLC (hexane-Et₂O-MeOH 10: 100:8) gave "dimer" 24b (44 mg), "dimer" 24c (17 mg), and trifluoroalcohol 18b (27.5 mg).

"Dimer" 24a: crystallized from acetone; mp 275–280 °C dec; $[\alpha]D - 92^{\circ}$ (c = 0.43); ir 3450, 1740, 1620 cm⁻¹; uv 264 (12 600), 291 (11 900), 297 (11 900) nm; CD 263 (31.2), 284 (-4.6), 296 (-4.6), 312 (-11.5); ¹H NMR δ 9.60 (1 H, C(16)–OH), 8.75 (s, 1 H, N_{a'}–H), 7.3–6.8 (aromatic), 6.90 and 5.97 (s, 1 H, C(9)–H and C(12)–H), 5.71 (dd, 1 H, $J_{14,15} = 9.5$ and $J_{3,14} = 3$ Hz, C(14)–H), 5.20 (s, 1 H, C(17)–H), 5.00 (br d, 1 H, J = 9.5 Hz, C(15)–H), 3.87 (s, 3 H), 3.72 and 3.70 (2 s, 6 H, C(11)–OCH₃, C(16)–CO₂CH₃, and C(16')–CO₂CH₃, 2.63 (s, 3 H, N_a–CH₃), 1.99 (s, 3 H, OCOCH₃), 0.93 (t, 3 H, J = 7 Hz) and -0.12 (t, 3 H, J = 6.8 Hz, C(18')–H and C(18)–H; MS m/e 794.4195 (calcd 794.4254, C4₆H₅₈N4O₈, M·⁺), 763, 736, 735.4066 (calcd 735.4121, C4₄H₅₅N4O₆), 635, 611, 610.2920 (calcd 610.2917, C₃₆H₄₀N₃O₆), 469, 338, 282.1330 (calcd 282.1341, C₁₄H₂₀NO₅), 222, 188, 138.1284 (calcd 138.1283, C9H₁₆N, 100%), 135, 124, 122, 121, 107.

"Dimer" 24b (20'-epi "dimer" 24a): crystallized from acetone-ether; mp 218-220 °C dec; $[\alpha]D - 66^{\circ}$ (c = 0.93); ir 1740, 1620 cm⁻¹; uv 264 (13 400), 291 (11 200), 298 nm (11 400); CD 257 (34.0), 280 (-2.9), 294 (-2.9), 310 (-9.9); ¹H NMR δ 9.64 (1 H, C(16)-OH), 8.78 (s, 1 H, $N_{a'}$ -H), 7.5-6.8 (aromatic), 6.85 and 6.02 (s, 1 H, C(9)-H and C(12)-H), 5.72 (dd, 1 H, $J_{14,15} = 10$ and $J_{3,14} = 4$ Hz, C(14)-H, 5.23 (s, 1 H, C(17)-H), 5.02 (d, 1 H, J = 10 Hz, C(15)-H), 3.89 (s, 3 H) and 3.74 (br s, 6 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃), 2.64 (s, 3 H, N_a-CH₃), 2.00 (s, 3 H, OCOCH₃), 0.92 (t, 3 H, J = 7 Hz) and -0.12 (t, 3 H, $J \sim 7$ Hz, C(18')-H and C(18)-H); MS m/e 794.4236 (calcd 794.4254, $C_{46}H_{58}N_4O_8$, M·⁺), 763, 736, 735.4087 (calcd 735.4121, C44H55N4O6), 635.3939 (calcd 635.3961, C40H51N4O3), 611.3014 (calcd 611.2995, $C_{36}H_{41}N_3O_6$), 610.2925 (calcd 610.2917, C₃₆H₄₀N₃O₆), 527, 469, 338.1989 (calcd 338.1994, C₂₁H₂₆N₂O₂), 282.1334 (calcd 282.1341, C14H20NO5), 222, 188, 144, 138.1281

"Dimer" 24d (C(5)–C(6) fragmentation) (violet with CAS reagent): 67.6 mg, 17%, crystallized from cyclohexane; mp 188 °C; $[\alpha]D - 27.2^{\circ}$ (c = 0.68); uv 252 (13 900), 258 (sh 13 300), 288 (10 100), 296 (11 200); CD 257 (11.4), 280 (-3.0), 305 (-2.7); ¹H NMR δ absence of N_a-H, 7.3-6.9 (4 H, aromatic), 6.35 and 6.09 (s, 1 H, C(9)–H and C(12)–H), 5.77 (m, 1 H, $J_{14,15} = 9.6$ Hz), 5.38 (s, 1 H, C(17)–H), 5.19 (d, 1 H, J = 9.6 Hz, C(15)–H), 5.11 and 4.96 (2 d, 2 H, $J_{AB} =$ 11.5 Hz, C(5')–H), 3.88, 3.78, and 3.22 (s, 3 H, C(11)–OCH₃, C(16)–CO₂CH₃, and C(16')–CO₂CH₃), 2.67 (s, 3 H, N_a–CH₃), 2.04 (s, 3 H, OCOCH₃), 0.89 (t, 3 H, $J \sim 7$ Hz) and 0.24 (t, 3 H, $J \sim 6.5$ Hz, C(18')–H and C(18)–H; MS *m/e* 792 (M·⁺), 733, 645, 633, 631, 552, 525, 511, 510, 497, 396, 337, 308, 282, 222, 202, 200, 188, 174, 154, 136, 135 (100%), 122, 121, 107.

Trifluoro alcohol 18a: crystallized from acetone; mp 275–280 °C; [α]D –15.8° (c = 1.07); ir 3380 (OH), 1740 (esters), 1610 cm⁻¹ (indoline); uv 258 (8000) and 307 nm (4700), dihydroindole; ¹H NMR (60 MHz) δ 6.72 and 6.00 (s, 1 H, C(9)–H and C(12)–H), 5.8 (dd, 1 H, C(14)–H), 5.34 (s, 1 H, C(17)–H), 5.18 (d, 1 H, J_{14,15} = 9.9 Hz, C(15)–H), 3.82 and 3.76 (s, 3 H, C(11)–OCH₃ and C(16) –CO₂CH₃, 2.67 (s, 3 H, N_a–CH₃), 2.01 (s, 3 H, OCOCH₃), 0.46 (t, 3 H, J_{18,19} = 7 Hz, C(18)–H); MS *m/e* 554 (M·⁺), 495, 395, 286, 282, 272, 260, 259, 202, 188, 136, 135 (100%), 122, 121, 107.

Trifluoro alcohol 18b: $[\alpha]D - 35.7^{\circ}$ (c = 1.31); ir 1745, 1620 cm⁻¹; uv 258 (7400), 307 nm (4600); ¹H NMR (60 MHz) δ 6.99 and 6.06 (s, 1 H, C(9)-H and C(12)-H), 5.80 (dd, 1 H, $J_{14,15} \sim 10$ Hz, C(14)-H), 5.34 (s, 1 H, C(17)-H), 5.18 (d, 1 H, $J \sim 10$ Hz, C(15) -H), 3.82 and 3.76 (s, 3 H, C(11)-OCH₃ and C(16)-CO₂CH₃), 2.76 (s, 3 H, N_a-CH₃), 2.01 (s, 3 H, OCOCH₃), 0.46 (t, 3 H, $J_{18,19} = 7$ Hz, C(18)-H); MS, fragmentation pattern similar to that of **18a**.

Coupling of Catharanthine N-Oxide (7) with Vindorosine (2b). Trifluoroacetic anhydride (0.05 ml, 0.36 mmol) was added to a stirred solution of catharanthine N-oxide (50 mg, 0.14 mmol) and vindorosine³⁸ (2b) (63 mg, 0.15 mmol) in CH₂Cl₂ (0.4 ml) at 0 °C under argon. After 50 min usual workup led to a mixture which was purified by preparative TLC (eluent CHCl₃-MeOH 97:3), yielding 25 (20 mg, 18%) and 2b (51 mg, 81%).

"Dimer" 25: $[\alpha]D - 40^{\circ}$ (c = 0.5); ir 1745, 1620 cm⁻¹; uv 262 (14 300), 286 (11 200), 294 nm (10 400); CD 257 (-13.0), 285 (7.1), 303 (8.4); ¹H NMR δ 9.12 (1 H, C(16)-OH), 6.83 (br s attributed to C(9)-H), 6.34 (d, 1 H, J = 8.5 Hz, C(12)-H), 5.77 (m, 2 H, C(14)-H and C(15')-H), 5.34 (s, 1 H, C(17)-H), 5.15 (d, 1 H, $J_{14,15} = 10$ Hz, C(15)-H), 3.82 and 3.79 (2 s, 6 H, C(16)-CO₂CH₃ and C(16')-CO₂CH₃), 2.70 (s, 3 H, N_a-CH₃), 2.11 (s, 3 H, OCOCH₃), 1.07 (t, 3 H, $J \sim 7$ Hz, C(18')-H), 0.27 (t, 3 H, $J \sim 6.5$ Hz, C(18) -H); MS *m/e* 762 (M⁺⁺), 703, 603, 580, 495, 480, 349, 336, 282, 135 (100%), 122, 121, 107.

Coupling of Catharanthine N-Oxide (7) with N_a -Methyl-2,16dihydrotabersonine (2c). Trifluoroacetic anhydride (0.17 ml, 1.18 mmol) was added to a stirred solution of catharanthine N-oxide (7) (150 mg, 0.43 mmol) and N_a -methyl-2,16-dihydrotabersonine³⁹ (2c) (157 mg, 0.45 mmol) in dry CH₂Cl₂ (1.2 ml) at -78 °C under argon. After 50 min the mixture is treated in the usual way and purified by preparative TLC (eluent heptane-AcOEt 50:50) to give 26 (36 mg, 12%) and 2c (80 mg, 51%).

"Dimer" 26: $[\alpha]D 7.3^{\circ}$ (c = 1.19); ir 1745, 1620 cm⁻¹; uv 273 (11 500), 286 (sh, 9700), 295 nm (sh, 7900); CD 264 (12.8), 304 (5.8); ¹H NMR δ 7.5–6.8 (6 H, aromatic) 6.33 (d, 1 H, $J_{11,12} = 8.5$ Hz, C(12)–H), 5.69 (dd, 1 H, $J_{14,15} = 9.5$ and $J_{3,14} = 4.5$ Hz, C(14)–H), 5.40 (m, 1 H, C(15')–H), 5.33 (br d, 1 H, J = 9.5 Hz, C(15)–H), 3.73 and 3.60 (s, 3 H, C(16)–CO₂CH₃ and C(16')–CO₂CH₃), 2.69 (s, 3 H, N_a–CH₃), 1.01 (t, 3 H, J = 7.0 Hz) and 0.60 (t, 3 H, J = 6.5 Hz, N_a-Methyl-2,16-dihydro-11-methoxytabersonine (2d). A 30% aqueous formaldehyde solution (2.7 ml), 10 drops of pure acetic acid, and sodium cyanoborohydride (132 mg) in four portions were added successively to a stirred solution of 2,16-dihydro-11-methoxytabersonine⁴⁰ (210 mg, 0.57 mmol) in THF (4 ml). After 15 min, the mixture was poured into water (40 ml) and extracted three times with CHCl₃. Usual workup led to N_a-Methyl-2,16-dihydro-11-methoxytabersonine (2d) (200 mg, 91%) crystallized from methanolimp 105 °C dec; [α]D 30° (c = 0.48); ir no N-H, 1740, 1625 cm⁻¹; uv 256 (7270), 308 (5120) nm; ¹H NMR (60 MHz) δ 6.86 (d, 1 H, J_{9,10} = 8 Hz, C(9)-H), 6.19 (dd, 1 H, J_{10,12} = 2 and J_{9,10} = 8 Hz C(10)-H), 6.00 (s, 1 H, C(12)-H), 5.72 (dd, 1 H, J_{14,15} = 10 and J_{3,14} = 4.7 Hz, C(14)-H), 5.33 (d, 1 H, J_{14,15} = 10 Hz, C(15)-H), 3.74 and 3.70 (s, 3 H, C(11)-OCH₃ and C(16)-CO₂CH₃), 2.68 (s, 3 H, N_a-CH₃), 0.53 (t, 3 H, J_{18,19} = 6.6 Hz, C(18)-H); MS *m/e* 382 (M·⁺), 351, 296, 189, 188, 174, 136, 135 (100%), 122, 121.

Coupling of Catharanthine N-Oxide (7) with N_a -methyl-2,16-dihydro-11-methoxytabersonine (2d). Trifluoroacetic anhydride (0.110 ml, 0.78 mmol) was added to a stirred solution of catharanthine Noxide (7) (100 mg, 0.29 mmol) and N_a -methyl-2,16-dihydro-11methoxytabersonine (2d) (114 mg, 0.30 mmol) in 0.82 ml of dry CH₂Cl₂ at -78 °C under argon. After 60 min, the mixture was treated in usual way and the residue obtained was purified by preparative TLC (CHCl₃-MeOH 97:3), giving 27a (40 mg, 19%), 27b (6 mg, 3%), 19a (trifluoro alcohol, 40 mg, 27%), and a mixture of "dimer" 28 and trifluoro alcohol 19b. This mixture was purified by preparative TLC (CHCl₃-MeOH 99:1) and yielded 28 (12 mg, 6%) and 19b (30 mg, 21%).

"Dimer" 27a: $[\alpha] D 87^{\circ} (c = 0.42)$; ir 1740, 1625 cm⁻¹; uv 218 (44 600), 268 (14 000), 290 (11 600), 294 (11 200) nm; CD 263 (13.4), 305 (5.8); ¹H NMR δ 7.96 (s, 1 H, N_a'-H), 7.5-7.0 (4 H, aromatic), 6.54 and 6.08 (s, 1 H, C(9)-H and C(12)-H), 5.70 (dd, 1 H, $J_{14,15} = 11$ and $J_{3,14} = 4.5$ Hz, C(14)-H), 5.55 (m, 1 H, C(15') -H), 5.32 (d, 1 H, J = 11 Hz C(15)-H), 3.85, 3.78, and 3.65 (s, 3 H, C(11)-OCH₃, C(16)-CO₂CH₃, and C(16')-CO₂CH₃), 2.80 (s, 3 H, N_a -CH₃), 1.12 (t, 3 H, $J_{18',19'} = 7$ Hz, C(18')-H), 0.97 (t, 3 H, $J_{18,19} = 6.5$, C(18)-H); MS *m/e* 718 (M·+), 687, 659, 595, 536, 395, 336 (100%), 295, 293, 135, 122, 121, 107.

 N_a -Formyl-2,16-dihydro-11-methoxytabersonine (2e). 2,16-Dihydro-11-methoxytabersonine (260 mg, 0.7 mmol) was dissolved in a mixture of acetic anhydride-formic acid (50:50) preheated at 60 °C for 2 h. After stirring for 60 min at room temperature, the mixture was made alkaline with an aqueous solution fo Na₂CO₃ (10%), extracted with CHCl₃, washed with water, dried, and evaporated to yield

Na-formyl-2,16-dihydro-11-methoxytabersonine (270 mg, 97%), crystallized from chloroform-methanol: mp 180 °C dec; $[\alpha]D - 28.6^{\circ}$ (c = 1.05); ir no N-H absorption, 1745, 1680 cm⁻¹; uv 252, 300 nm; ¹H NMR (60 MHz) δ 6.96 (d, 1 H, $J_{9,10}$ = 8 Hz, C(9)-H), 6.66 (s, 1.5 H, C(12)-H and a masked part of C(10)-H), 6.50 (d, part of dd, $0.5 \text{ H}, J_{10,12} = 2 \text{ and } J_{9,10} = 8 \text{ Hz}, \text{ part of } C(10)-H), 5.83 \text{ (dd, 1 H,}$ $J_{14,15} = 10$ and $J_{3,14} = 4.8$ Hz, C(14)-H), 5.20 (d, 1 H, $J_{14,15} = 10$ Hz, C(15)-H), 3.80 and 3.70 (s 3 H, C(11)-OCH₃ and C(16)- CO_2CH_3 , 0.76 (t, 3 H, $J_{18,19} \sim 6$ Hz C(18)-H); MS m/e 396 (M·+), 368, 366, 310, 202, 135 (100%), 122, 121.

Coupling of Catharanthine N-Oxide (7) with N_a -formyl-2,16-dihydro-11-methoxytabersonine 2e. Trifluoroacetic anhydride (0.110 ml, 0.78 mmol) was added to a stirred solution of catharanthine Noxide (7) (100 mg, 0.29 mmol) and N_a -formyl-2,16-dihydro-11methoxytabersonine (2e) (117 mg, 0.3 mmol) in 0.82 ml of CH₂Cl₂ at -78 °C under argon. After 50 min, the mixture was treated in usual way and the residue obtained was purified by alkaline preparative TLC (eluent CHCl₃-MeOH (95:5), yielding 2e (110 mg, 94%) and unidentified products (37 mg).

Acknowledgment. We thank the Ligue Nationale Française contre le Cancer for a grant to F. Gueritte, Dr. P. Bladon for high resolution mass spectrometry, Dr. S. K. Kan and his coworkers and R. Z. Andriamialisoa for 240-MHz ¹H NMR spectrometry, and Eli Lilly Laboratories (Dr. N. Neuss) for comparison samples.

Kinetic Applications of Electron Paramagnetic Resonance Spectroscopy. 27. Isomerization of Cyclopropylcarbinyl to Allylcarbinyl¹

B. Maillard,^{2a} D. Forrest,^{2b} and K. U. Ingold*

Contribution from the Division of Chemistry, National Research Council of Canada, Ottawa, Canada K1A 0R9. Received March 29, 1976

Abstract. The rate constant for isomerization of cyclopropylcarbinyl to allylcarbinyl has been measured by EPR spectroscopy. It can be represented by: $\log(k_i/s^{-1}) = (12.48 \pm 0.85) - (5.94 \pm 0.57)/\theta$, where $\theta = 2.3RT$ kcal/mol. This reaction is compared with other primary alkyl radical isomerizations.

The rapid isomerization of the cyclopropylcarbinyl radical (1) to the allylcarbinyl radical (2) is well known in free-radical chemistry.³ The rate of this reaction has not been measured and we are aware of only one analogous reaction for which a rate constant has been estimated. For Cristol and Barbour's⁴ data on the reduction of 6β -chloro- 3α , 5α -cyclocholestane (3)
