Abstract

In connection with our interest in the use of multidentate ligands for the preparation of iron complexes as models for the active site of the metalloenzyme transferrin, we have prepared the title compound [*N*-(2-pyridylmethyl)-2,2'-(iminodimethyl)diphenol, C₂₀H₂₀N₂O₂], which contains one amine and one pyridine N atom and two phenolate O atoms capable of forming a N₂O₂ donor set.

Comment

Multidentate ligands derived from amines containing phenolate-type and α -pyridyl groups as pendant arms are recognized as an important class of ligands, since they are able to mimic the amino acid residues tyrosine and histidine, respectively, in the active site of certain metalloenzymes such as transferrins (Pyrz, Roe, Stern & Que, 1985) and purple acid phosphatases (Que, 1990). In this work, we report the synthesis and crystal structure of a new tetradentate ligand, H₂BBPA, which may act as a potent chelator for M^{3+} transition metals. This is part of our programme of preparation and characterization of iron and vanadium complexes with bioinorganic relevance (Neves, Brito *et al.*, 1993; Neves, Vencato & Mascarenhas, 1994; Neves, Ceccato *et al.*, 1993).

The crystal structure reveals that H₂BBPA exhibits adequate geometry of the N1, N2 and O2 donor atoms for facial coordination in octahedral complexes. The bond angles around the amine N atom range from 108.5(7) to 110.6(6)° and show that the N2 atom lies in a slightly distorted tetrahedral environment. The C—O(phenol) distances are very similar [C13—O1 = 1.411(9) and C20—O2 = 1.39(1) Å] and agree very well with the corresponding distances detected in related ligands (Campbell, Parsons & Pennington, 1993; Neves *et al.*, 1995). The pyridine ring in the title compound is planar and forms dihedral angles of 81.2(2) and 14.6(9)° with the C8—C13 and C15—C20 phenol rings, respectively.

Fig. 1. The atomic numbering scheme and hydrogen bonds. Displacement ellipsoids are plotted at the 50% probability level. H atoms of the phenol O atoms have arbitrary size and other H atoms are omitted.

Finally, the relatively compact conformation adopted by the molecule is achieved through one intramolecular hydrogen bond involving a phenolic proton and the aliphatic N atom [O1...N2 2.709 (8), H(O1)...N2 1.70 Å, O1—H(O1)...N2 158°] and an internal bifurcated hydrogen bond involving the other phenolic proton, the pyridine N atom and the aliphatic N atom [O2...N1 = 2.746 (1), H(O2)...N1 1.90 Å, O2—H(O2)...N1 150°; O2...N2 3.275 (10), H(O2)...N2 2.50 Å, O2—H(O2)...N2 133°; angle N1...H(O2)...N2 76°].

Experimental

To a solution of (2-hydroxybenzyl)(2-pyridylmethyl)amine (35 mmol) (Neves, Brito *et al.*, 1993) in tetrahydrofuran (100 ml) was added 2-bromomethylphenyl acetate (35 mmol) (Karlin, Cohen, Hayes, Farooq & Zubietta, 1987) under an argon atmosphere. After the addition of Et₃N (120 mmol) and stirring for 24 h a precipitate of Et₃NHBr (6.0 g) formed, which was removed by filtration. After removal of the solvent by rotatory evaporation, a yellow oil was obtained which was dissolved in methanol (100 ml) and KOH (53 mmol), refluxed for 40 min and then cooled to room temperature. A white precipitate of the desired ligand was filtered off, washed with cold methanol and ether, and dried under vacuum. Yield 5.7 g (51%), m.p. 445–446 K. ¹H NMR (CDCl₃); δ 3.6–3.8 (*m*, 6H, N-CH₂py; N-CH₂Ph), 6.6–7.7 (*m*, 11H, phenyl and pyridine), 8.7 (*d*, 1H, α-pyH). Single crystals were obtained by recrystallization from a methanolic solution of the title compound.

Abstract

A new polymorphic form of the title compound, di-1,4-butanediylthiuram disulfide [1,1'-dithiodicarbonylthiylbis(pyrrolidine)], C₁₀H₁₆N₂S₄, has been determined in the triclinic system. There are two simultaneous reports on structure determinations of this compound in the monoclinic system [Ymen (1983). *Acta Chem. Scand. Ser. B*, **37**, 707–713; Williams, Statham & White (1983). *Aust. J. Chem.* **36**, 1371–1377]. The two forms show differences in the conformation of one of the two pyrrolidine rings of the molecule.

† On leave from the Department of Physics, Anna University, Madras 600 025, India.

Comment

It is known that several metal dithiocarbamates are being used as pesticides, vulcanizing agents, antioxidants and lubricants, and therefore studies on these compounds has attracted interest since as early as 1908 (Thorn & Ludwig, 1962). However, the instability of some metal dithiocarbamates in several solvents leads to decomposition of the complex instead of recrystallization. As an example, crystals of the title compound, dipyrrolidinyldithiuram disulfide (DPTD), were obtained by slow evaporation of tetrakis(pyrrolidine-1-carbodithioato)thorium(IV) from dimethyl sulfoxide (Williams, Statham & White, 1983). DPTD crystals were also obtained by bubbling air through an aqueous ethanol solution of NaS₂CN(CH₃)₂·2H₂O (Ymen, 1983). The DPTD crystals thus obtained belonged to the monoclinic space group C2/c, the molecule having C₂ symmetry. In our studies on the reactivity of some metal dithiocarbamates, recrystallization of [Fe{S₂CN(CH₂)₄}₃] from methanol gave some single crystals suitable for X-ray diffraction studies. Surprisingly, the crystals were found to be those of DPTD but belonging to the triclinic space group P $\bar{1}$ instead. In the triclinic form, the molecule occupies a general equivalent position and does not have any symmetry. DPTD has been reported as a potent inhibitor of the cytoplasmic aldehyde dehydrogenases of sheep liver (Kitson, 1976), hence the present report may be useful in assessing which form is more active in this regard.

A displacement ellipsoid plot of the DPTD molecule with the numbering scheme is shown in Fig. 1. The two pyrrolidine rings adopt two different conformations; ring 1 (N1, C2, C3, C4, C5) is a half-chair and ring 2 (N1A, C2A, C3A, C4A, C5A) adopts an envelope conformation. The deviations of atoms C3 and C4 from the plane of the other ring 1 atoms (N1, C2, C5) are –0.321 (6) and 0.226 (6) Å, respectively. In ring 2, C3A is the pivot atom of the envelope and deviates by 0.360 (7) Å from the plane formed by the remainder of the atoms (N1A, C2A, C5A, C4A). The asymmetry parameters according to Nardelli (1983a) are $D_2(N1) = 0.011$ (2) for ring 1 and $D_5(C3A) = 0.006$ (3) for ring 2. In the monoclinic form, the pyrrolidine rings both have half-chair conformations, and the bond lengths and angles show some deviations from those of ring 1 in the present triclinic form. The two S₂CN groups in the triclinic form (S1, S2, C1, N1 and S1A, S2A, C1A, N1A) are individually planar and make a dihedral angle of 91.13 (5)° with respect to one another, which is close to the angle of 86.01 (3)° found in the monoclinic form. The two terminal S atoms, S1 and S1A, tend to be further apart in the triclinic form (4.175 Å) than in the monoclinic form (4.048 Å).
