## Triphenylpropylpiperazine Derivatives as New Potent Analgetic Substances

G. L. Regnier,\* R. J. Canevari,

Chemical Research Division

J. C. Le Douarec, S. Holstorp, and J. Daussy

Pharmacological Research Division, Science Union et Cie, Groupe de Recherches des Laboratoires Servier, Suresnes 92, France.

Received June 18, 1971

Sixty-four 1,4-disubstituted piperazines have been synthesized in which the 1 substituents are chiefly triphenylpropyl or *i*-Pr groups and the 4 substituents are pyrimidyl and its substituted derivatives, as well as closely related isosteric heterocycles, such as pyridazinyl, pyrazinyl, triazinyl, thiazolyl, and quinazolinyl. These compounds have a methadone-like structure and the most interesting one (25) shows good analgetic properties and seems to have a low dependence liability.

Many synthetic organic compounds with pronounced morphine-like activity have been described and among them, the diphenylpropylamines related to methadone. Up to now, several hundred of these compounds have been synthesized<sup>1a</sup> but no significant separation of analgesia and dependence liability has been demonstrated in that field. Nevertheless certain quantitative and time-effect differences have helped to make methadone the drug of choice, generally as a substitute for another opiate to minimize withdrawal symptoms. Thus we undertook a search for compounds structurally related to methadone with the structural requirements

hoping to obtain compounds useful in the relief of pain, and, as far as possible, devoid of addicting properties and other undesirable effects. Generally, it is considered<sup>1b</sup> that the most active products are those in which X is an electronegative substituent taken from the following group listed in decreasing order of potency: CON<, COR, >CHOCOR, OCOR, CN, etc. . . associated with the presence of a Me group in the α or β position. The N substituent is a basic dialkylamino or cycloalkylamino group. The greatest activity is usually confined to the levo form of the β-branched compounds, the α-branched one being nearly inactive. Our approach was influenced by 2 observations: (1) when we began an extensive research on vasodilatory piperazine derivatives<sup>2</sup> 10 years ago, we discovered a clear but not pronounced analgetic activity in one of them, the pyrimidylpiperazine II.

We therefore took this as a structural basis for the basic dialkylamino group in I, despite the fact that some authors<sup>3,4</sup> have pointed out a weak activity and high toxicity for piperazine derivatives structurally related to methadone; (2) a search of the literature revealed that the electronegative Ph group had rarely been employed as a third substituent X. Nevertheless, the triphenylpropylamine structure was included in the structure of spasmolytic substances studied by Swedish workers.<sup>5</sup> These findings prompted us to synthesize some compounds of the following formula:

To study the effect of appropriate changes on the activity of this class of compounds, structure III was divided into 4 portions and each one was varied selectively (See Tables II, III, and IV).

(a) In portion A, R<sub>1</sub> is more generally Ph optionally substituted by an alkoxy group. In 3 compounds (9, 11, 12) R<sub>1</sub> is H and in one R<sub>1</sub> is CN (10).

(b) In portion B, which is usually an unbranched (CH<sub>2</sub>)<sub>n</sub> chain (n = 2), we studied the influence of lengthening the chain as well as its α branching. Unfortunately we did not succeed in preparing the β-branched compound.†

(c) For the modification of portion C, we altered piperazine to 2-methylpiperazine, homopiperazine, and decahydroquinoxaline.

(d) In portion D, the pyrimidine group optionally substituted by various groups (See Table III), was replaced en-

†The reaction of the 1-methyl-3,3,3-triphenylpropyl *p*-toluenesulfonate with a monosubstituted piperazine failed and 4,4,4-triphenyl-2-butene was exclusively found as the Swedish workers have described it in the case of its condensation with morpholine.

<sup>a</sup>AE, abs EtOH. <sup>b</sup>Uncor bp or mp, K, Kofler block; MK, Kofler hot stage microscope; cap, Mel-Temp capillary mp app. <sup>c</sup>All compounds have been analyzed for C, H, N with results (±0.4% limit), by means of a Perkin-Elmer Autoanalyser 240. <sup>d</sup>Prepd by alk hydrolysis of the 1-(3,3,3-triphenylpropyl)-2-methyl-4-carbethoxypiperazine, itself prepd from 1-carbethoxy-3-methylpiperazine by method C (See ref 2). <sup>e</sup>Prepd by analogy with ref 6 (See Experimental Section).

tirely by isosteric structures such as pyridazine, pyrazine, triazine, and thiazole.

**Chemistry.** The synthesis of these compounds was performed according to 4 general methods:

In method A, a substituted halogeno heterocycle was generally condensed with the appropriate N-monosubstituted piperazine in DMF in the presence of K<sub>2</sub>CO<sub>3</sub>. In method B, an appropriately substituted 2-methylthiopyrimidine was heated with an N-monosubstituted piperazine in equimolar proportion. In method C, a *p*-Ts ester was heated with an excess of an N-monosubstituted piperazine. In method D, the Cl atom of a 1-substituted 4-(chloropyridazinyl or *s*-triazinyl)piperazine was hydrogenolyzed under pressure over Pd/C.

**Structure-Activity Relationships (Table V).** The first few compounds studied in this series appeared to be powerful central analgetics. Their spectrum of activity together with numerous evident symptoms (Straub tail, antagonism to nalorphine, etc.) indicated that we were dealing with morphine-like properties.

We tried at first to establish the ideal chemical structure. Later, syntheses were conducted according to theories of antagonist-agonist interactions<sup>7</sup> as regards the analgetic re-

ceptor. Some derivatives behaved as antagonists to the other but were unfortunately devoid of any valuable agonistic activity of their own, pentazocine for example. Finally some members were selected and carefully studied for dependence liability, insofar as we could predict it from our animal studies. A brief account of the main facts emerging from this part of the work will be given.

To explain rather complicated structure-activity relationships, it is useful to show the most interesting structure (i.e., **25**) and to summarize the way in which modifications in its 4 main parts (*cf.*, structure III) influence the activity.

In part A, the presence of only 2 Ph groups in this part of the molecule with X = H or CN abolished the analgetic properties (**9**, **10**). Although the activity is not destroyed when D is pyrazinyl or pyridazinyl (**11**, **12**) it is still decreased. Clearly, the (C<sub>6</sub>H<sub>5</sub>)<sub>3</sub>C groups must be kept intact. In part B, the introduction of an additional CH<sub>2</sub> diminishes the activity, which is maintained but not increased when the chain is  $\alpha$  branched (**15**, **16**, **18**) as in the isomethadone series. In part C, any modification of the piperazine ring is unfavorable (**19**, **20**, **21**, **22**). The most interesting part of structure III is D, where the kind of heterocyclic nucleus closely determines the activity, the order of the decreasing activity being: pyrazine (**62**) > pyrimidyl (**25**) > pyridyl (**56**) > pyridazinyl (**57**) > triazinyl inactive (**68**). Other N heterocycles were inactive. As far as the substitutions on the heterocyclic nucleus are concerned, Me or Me<sub>2</sub> in any position are not unfavorable (**27**, **28**, **29**, **63**, **67**), but 5 substitution on the pyrimidine ring was generally unproductive as shown in the inactive Me<sub>3</sub> (**30**) or Me<sub>2</sub>C<sub>6</sub>H<sub>5</sub> (**31**) derivatives. This holds also for **34–41** with 5-CN, OH substitutions which are inactive or only slightly active except for 4-EtO (**34**) and 5-CO<sub>2</sub>H (**35**) in which the activity is only diminished compared to **25**. Amino substitution is very favorable chiefly on the pyrimidine ring (**42**), but the NH<sub>2</sub>

group must be kept intact otherwise the activity decreases (44-52). Antagonistic properties to 25 and 42 are induced by N-substituting  $\text{NH}_2$  in 42 with allyl (47) or cyclopropylmethyl (48). The appearance of antagonistic properties in these last 2 compounds, although limited enough inasmuch as 47 enhances the morphine effect, may be compared to a certain extent, with a more general antagonistic effect observed with the same kind of N substitutions in the morphine, morphinan, and benzomorphan series. Table VI points out the potency of the most interesting compounds by using 2 additional methods.<sup>13,14</sup> The second one, particularly, allows us to locate the level of analgetic activity by the animals' behavioral response, with peripheral, medullary, central, and cortical components. Antitussive properties<sup>16</sup> were also taken into account.

To conclude, 4 compounds (25, 62, 57, 47) have been selected for extensive pharmacological studies. Compd 25 has an analgetic potency between that of morphine and codeine; it is almost devoid of respiratory depressant action and seems to have a low dependence liability, as judged by the appearance of a slight abstinence syndrome following withdrawal of the drug from tolerant animals and also by the fact that the animals never self-administered the compound in the course of selected experiments according to Kumar<sup>8</sup> (See Table VI).

Compd 62 is the most active in the series (as potent as morphine) but it induces bizarre behavioral effects after cessation of a 3-week treatment. The most striking withdrawal effect was fighting similar to that observed by Schneider<sup>9</sup> for apomorphine and LSD.

Compd 47 antagonized the actions of 25 and 62 while enhancing the morphine effect under the same conditions. Its analgetic potency is rather low but pentazocine is also inactive in the same tests, except in writhing tests where it is fairly active.<sup>10</sup>

Compd 57 behaves codeine-like and seems very similar to that drug in regard to potency, dependence liability, and general pharmacology.

## Experimental Section†

**I. Pharmacological Methods. (a) Analgetic Activity.** The analgetic activity was detd in mice by the modified hot plate test<sup>11</sup> and the phenylquinone writhing test.<sup>12</sup> The results were expressed according to the following scale: +, 25%; ++, 50%; +++, 75%; +++, 100% inhibition or more.

Two methods were used in rats: those of Randall and Selitto<sup>13</sup> and Carroll and Lim modified by Charpentier.<sup>14</sup> The results are given as  $\text{ED}_{50}$ 's for the former method. For the latter the results are given as the dose which decreases by 50% the total response as far as the cry and biting the electrodes are concerned, inasmuch as only these 2 parameters are specifically modified by the central analgetic substances while both the jump and the escape are not modified except with toxic doses.

**(b) Antiinflammatory Activity.** Paw edema in the rat was produced with carrageenin according to Winter *et al.*<sup>15</sup> The data are given in a simplified form as follows: +, 20%; ++, 30%; +++, 40%; +++, 50% inhibition or more.

**(c) Antitussive Activity.** Cough was induced in guinea pigs with a citric acid aerosol according to Charlier, *et al.*<sup>16</sup> The figures given represent  $\text{ED}_{50}$ 's.

**II. Chemical Methods. (1) Substituted Halogenoheterocycles.** The following compds were prepd according to lit. methods: 2-chloropyrimidine,<sup>17</sup> 4-chloropyrimidine,<sup>18</sup> 4-methoxy-2-chloropyrimidine,<sup>19</sup> 4-benzyloxy-2-chloropyrimidine,<sup>2</sup> 4-amino-2-chloro- and 2-amino-4-chloropyrimidine,<sup>20</sup> 4-methylamino-2-chloropyrimidine,<sup>2</sup>

4-dimethylamino-2-chloropyrimidine,<sup>21</sup> 4-methyl-2-chloropyrimidine,<sup>22</sup> 4,5-dimethyl-2-chloropyrimidine,<sup>23</sup> 4,6-dimethyl-2-chloropyrimidine,<sup>24</sup> 4,6-dimethyl-5-phenyl-2-chloropyrimidine,<sup>25</sup> 2,5-dichloropyrimidine,<sup>26</sup> 5-cyano-2-chloropyrimidine,<sup>27</sup> 4-chloro-5-carbethoxy-2-methylthiopyrimidine,<sup>28</sup> 5-chlorosulfonyl-2-chloropyrimidine,<sup>29</sup> 2-chloroquinazoline,<sup>30</sup> 4-chloroquinazoline, and 4-chloro-2-methylquinazoline,<sup>31</sup> 6-methyl-3-chloropyridazine,<sup>32</sup> 6-amino-3-chloropyridazine,<sup>33</sup> 3,6-dimethyl-2-chloropyrazine,<sup>34</sup> 3-amino-2-chloropyrazine,<sup>35</sup> 6-methyl-2-chloropyrazine,<sup>36</sup> 4-amino-2,6-dichlorotriazine, and 4,6-diamino-2-chlorotriazine,<sup>37</sup> 2-chlorothiazole,<sup>38</sup> 4,6-bis(allylamino)-2-chlorotriazine.<sup>39</sup>

The following compds were prepd in our laboratory: 4,5,6-trimethyl-2-chloropyrimidine (mp 93°); 4-phenethylamino-2-chloropyrimidine (mp 81°); 4-allylamino-2-chloropyrimidine (mp 169°); 4-cyclopropylmethylamino-2-chloropyrimidine hydrochloride (mp 218-219°); 4-(cyclopenten-2-ylamino)-2-chloropyrimidine hydrochloride (mp 125°); and 4-(3,3-dimethylallylamino)-2-chloropyrimidine (mp 177°); 4-allylamino-5-nitro-2-chloropyrimidine [mp (cap) 49°] (see ref 40); 5-dimethylsulfamido-2-chloropyrimidine (mp 121°) from the 5-chlorosulfonyl derivative and  $\text{Me}_2\text{NH}$  in PhH; 6-allylamino-3-chloropyridazine (mp 107°) and 6-(3,3-dimethylallylamino)-3-chloropyridazine (mp 110°) from 3,6-dichloropyridazine and an EtOH soln of allylamine and 3,3-dimethylallylamine at 120°, respectively, in a stainless steel bomb. By the same method were prepd: 6-amino-2-chloropyrazine (mp 150°) and 6-allylamino-2-chloropyrazine hydrochloride (mp 110°). The others were obtd from commercial sources.

**5-Carbethoxy-2-methylthiopyrimidine** was obtd by heating under reflux 114 g (0.489 mole) of 4-chloro-5-carbethoxy-2-methylthiopyrimidine in a mixt of 912 ml of dioxan and 570 ml of  $\text{H}_2\text{O}$  with 114 g of activated Zn powder: yield, 58 g (60%); colorless liquid; bp 99-100° (0.5 mm);  $n_D^{25}$  1.5645. *Anal.* ( $\text{C}_8\text{H}_{10}\text{N}_2\text{O}_2\text{S}$ ) C, H, N.

† All melting and boiling points are uncorrected. Except otherwise mentioned, all the melting points in the experimental part were taken from a Kofler block. (See footnote b, Table II.) Where analysis are indicated only by symbols of the elements, analytical results were obtained within  $\pm 0.4\%$  of the theoretical values.

**5-Carboethoxy-4-ethoxy-2-methylthiopyrimidine** was obtained in 82% yield from the same starting material in EtOH: bp 112–120° (0.5 mm);  $n_D^{25}$  1.546, mp 51° (petr ether). *Anal.* ( $C_{10}H_{14}N_2O_3S$ ) C, H, N.

**Toluenesulfonate Esters.** The following esters were prepared according to ref 5: 1-methyl-1-*p*-toluenesulfonyl-3,3,3-triphenylpropane and 2-methyl-1-*p*-toluenesulfonyloxy-3,3,3-triphenylpropane. In the same manner were obtained 1-*p*-toluenesulfonyloxy-3,3-diphenylpropane [mp 60° (MeOH)] from 3,3-diphenylpropanol, bp 140–143° (0.7 mm),  $n_D^{25}$  1.581; 1-*p*-toluenesulfonyloxy-3-(4-biphenyl)-3,3-diphenylpropane [mp 115° (EtOH)] from 3-(4-biphenyl)-3,3-diphenylpropanol [mp 174° (Et<sub>2</sub>O)]; 1-*p*-toluenesulfonyloxy-3,3,3-triphenylpropane [mp 119° (EtOH)] from 3,3,3-triphenylpropanol [mp 109–110° (Et<sub>2</sub>O)]; 1-*p*-toluenesulfonyloxy-3-(4-methoxyphenyl)-3,3-diphenylpropane (oily) from 3-(4-methoxyphenyl)-3,3-diphenylpropanol, bp 225–230° (0.5 mm).

**Monosubstituted Piperazines.** All compounds described in Table I except 4 were synthesized according to the following method.

**1-(3,3,3-Triphenylpropyl)piperazine (2).** A mixture of 150 g (0.338 mole) of 1-*p*-toluenesulfonyloxy-3,3,3-triphenylpropane and 331 g (3.84 moles) of anhydrous piperazine was stirred under reflux at 140° for 6 hr. After cooling, the oily mixture was treated with H<sub>2</sub>O (1500 ml) and several times extracted with CHCl<sub>3</sub>. After removal of the solvent, the oily residue was distilled and gave 100 g (83%) of pure product: bp 210° (0.2 mm); mp 130°.

Some hetero-substituted piperazine derivatives were synthesized according to the preceding procedure.

**1-(3,6-Dimethyl-2-pyrazinyl)piperazine** was prepared from 3,6-dimethyl-2-chloropyrazine and anhydrous piperazine: yield 91%, bp 108–110° (0.6 mm); mp 73°. The dihydrochloride had mp 238–240° dec. *Anal.* ( $C_{10}H_{16}N_4 \cdot 2HCl$ ) C, H, N.

**1-(3-Amino-2-pyrazinyl)piperazine** was prepared from 2-chloro-3-aminopyrazine (Aldrich) and anhydrous piperazine: yield 50%; mp 162°. *Anal.* ( $C_8H_{13}N_5$ ) C, H, N.

Other piperazine derivatives were prepared according to literature methods: 1-(2-pyridyl)piperazine<sup>41</sup> and 1-(2-pyrimidyl)-2-methylpiperazine.<sup>2</sup>

**1-(4,4,4-Triphenylbutyl)piperazine (4)** was prepared by analogy with ref 6, by hydrolysis with 50% H<sub>2</sub>SO<sub>4</sub> of the 1-(4,4,4-triphenylbutyl)-4-tosylpiperazine, mp 177° (MeOH), itself prepared from 4,4,4-triphenylbutylamine and *N,N*-bis(2-chloroethyl)-*p*-toluenesulfonamide, in diethylene glycol dimethyl ether (yield 50%).

**1,4-Disubstituted Piperazines. Method A.** 1-(3,3,3-Triphenylpropyl)-4-(2-pyrimidyl)piperazine (25). A solution of 22.5 g (0.063 mole) of 1-(3,3,3-triphenylpropyl)piperazine and 6.6 g (0.057 mole) of 2-chloropyrimidine in 350 ml of DMF with 16 g (0.115 mole) of K<sub>2</sub>CO<sub>3</sub> was stirred and heated at 140° for 9 hr. After cooling, the salt was filtered off, and the solvent was evaporated to dryness *in vacuo*. The pasty residue was dissolved in 100 ml of anhydrous EtOH and clarified with Darco. On cooling to 0°, the product crystallized; it was filtered and washed with cold EtOH. After drying at 100° overnight *in vacuo*, 16 g (64.7%) of colorless crystals was obtained (mp 130°). **Bis-methane sulfonate** had mp 193–194° dec. *Anal.* ( $C_{29}H_{30}N_4 \cdot 2HSO_3CH_3$ ) C, H, N.

**Method B.** 1-(3,3,3-Triphenylpropyl)-4-(5-carboethoxy-2-pyrimidyl)piperazine (36). A mixture of 59.5 g (0.167 mole) of 1-(3,3,3-triphenylpropyl)piperazine and 33 g (0.166 mole) of 5-carboethoxy-2-methylthiopyrimidine was stirred and heated at 200° for 12 hr. After cooling to 70°, the syrupy residue was treated with 300 ml of hot petr ether and the crystals were filtered off. The crude product (69 g) was recrystallized twice from EtOH: yield, 53 g (63%); mp (MK) 117–118°.

**Method C.** 1-(3,3,3-Triphenylpropyl)-4-(2-pyridyl)piperazine (56). A mixture of 65 g (0.398 mole) of 1-(2-pyridyl)piperazine and 88 g (0.199 mole) of 1-*p*-toluenesulfonyloxy-3,3,3-triphenylpropane was stirred and heated at 135° for 11 hr. After cooling to 80°, the thick mixture was treated with H<sub>2</sub>O (400 ml) and CHCl<sub>3</sub> (250 ml), the aqueous layer was decanted and extracted several times with CHCl<sub>3</sub>, then discarded. The CHCl<sub>3</sub> layer was dried (K<sub>2</sub>CO<sub>3</sub>) and the solvent removed *in vacuo*. The crystalline residue was dissolved in 400 ml of hot EtOH and cleared with Darco. After cooling, the crystals were filtered off and recrystallized from 500 ml of EtOAc: yield, 45 g (51.9%); mp 148°.

**Method D.** 1-(3,3,3-Triphenylpropyl)-4-(3-pyridazinyl)piperazine (57). A slurry of 14 g (0.0296 mole) of 1-(3,3,3-triphenylpropyl)-4-(6-chloro-3-pyridazinyl)piperazine [mp (cap) 197° (MeOH)] in 1 l. of MeOH was stirred at room temperature under 6 kg/cm<sup>2</sup> of H<sub>2</sub> over 3 g of 5% Pd/C in the presence of 30 ml of 1 *N* NaOH. After 2 hr the theoretical quantity of H<sub>2</sub> was absorbed while the product went into solution. The catalyst was removed and the EtOH solution was concentrated. The

crude product was dissolved in CHCl<sub>3</sub> and the solution was washed several times with H<sub>2</sub>O. After removal of the solvent *in vacuo* the crystalline residue (12 g) was dissolved in 150 ml of hot EtOH and cleared with Darco. On cooling to 0° the product crystallized; it was filtered, washed with cold EtOH, and dried overnight in a vacuum desiccator: yield, 10.5 g (81.7%); mp 173°.

The starting material was prepared from a solution of equimolar quantities of 3,6-dichloropyridazine and 1-(3,3,3-triphenylpropyl)piperazine in MeOH, heated 12 hr under reflux, in the presence of NaHCO<sub>3</sub>: yield, 82.6%. *Anal.* ( $C_{29}H_{29}ClN_4$ ) C, H, N.

In the same manner were prepared the following starting materials: 1-(3,3,3-triphenylpropyl)-4-(6-chloro-3-pyridazinyl)piperazine (11), mp 120°, yield 50.4%; 1-(3,3,3-triphenylpropyl)-4-(4,6-dichloro-2-s-triazinyl)piperazine (68), mp 160°, yield 90%; and according to method A, 1-(3,3,3-triphenylpropyl)-4-(4-chloro-6-amino-2-s-triazinyl)piperazine (69), mp 200°, yield 60%.

**Other Methods for the Preparation of 1,4-Disubstituted Piperazines (See Tables II and III).** 1-(3,3,3-Triphenyl-3-cyanopropyl)-4-(2-pyrimidyl)piperazine (10). A slurry of 11.3 g (0.0585 mole) of diphenylacetonitrile and 2.3 g (0.0585 mole) of NaNH<sub>2</sub> in 75 ml of anhydrous PhMe was stirred and heated under reflux for 1 hr. When the metallation was finished, a solution of 14 g (0.0617 mole) of 1-(2-chloroethyl)-4-(2-pyrimidyl)piperazine (mp 61°) in 30 ml of PhMe was added and the mixture was treated as above for 8 hr. After cooling, it was heated with H<sub>2</sub>O (50 ml) and then extracted several times into 1 *N* HSO<sub>3</sub>Me. The acid solution was made alkaline with excess K<sub>2</sub>CO<sub>3</sub> and extracted with Et<sub>2</sub>O. After drying (K<sub>2</sub>CO<sub>3</sub>) of the extracts and removal of the solvent *in vacuo* the residue (15 g) was dissolved in 50 ml of anhydrous EtOH and the ice-cold solution was saturated with HCl gas. The crystalline product was filtered, washed with cold EtOH, and dried in a vacuum desiccator: yield 10.8 g of dihydrochloride; mp 178°. This salt was dissolved in 75 ml of H<sub>2</sub>O, and the solution was rendered alkaline with excess K<sub>2</sub>CO<sub>3</sub>. The filtered crystals were recrystallized from *i*-PrOH (25 ml): yield, 5.2 g (23.2%); mp 113°.

**1-(3,3,3-Triphenylpropionyl)-4-(2-pyrimidyl)piperazine (18).** A solution of 10 g (0.031 mole) of 3,3,3-triphenylpropionyl chloride (mp 130°) and 11.3 g (0.069 mole) of 1-(2-pyrimidyl)piperazine in 200 ml of anhydrous xylene was stirred and heated under reflux for 3 hr. After cooling, the white crystals were filtered off and washed with H<sub>2</sub>O, then recrystallized from 105 ml of AcOH: yield, 10.9 g (78.4%); mp 260°. The starting chloride was obtained by chlorination of 3,3,3-triphenylpropionic acid<sup>42</sup> in excess SOCl<sub>2</sub>.

**1-(3,3,3-Triphenylpropyl)-4-(4-hydroxy-2-pyrimidyl)piperazine Dihydrochloride (33).** A solution of 1-(3,3,3-triphenylpropyl)-4-(4-benzyloxy-2-pyrimidyl)piperazine dihydrochloride, mp (MK) 168–170°, in 600 ml of MeOH was stirred under 6 kg/cm<sup>2</sup> of H<sub>2</sub> over 2.5 g of 10% Pd/C. After 4 hr the theoretical quantity of H<sub>2</sub> was absorbed and the catalyst removed. The EtOH solution was concentrated *in vacuo* and the crystalline residue was dissolved in 200 ml of hot *i*-PrOH and 10 ml of 4 *N* HCl. On cooling to 5°, the dihydrochloride crystallized; it was filtered off and the crystals were washed with cold *i*-PrOH: yield, 8 g (61.5%); mp (MK) 176–180°. The starting material was prepared according to method A from 2-chloro-4-benzyloxy-2-pyrimidine: yield, 64%. *Anal.* ( $C_{26}H_{26}N_4O \cdot 2HCl \cdot H_2O$ ) C, H, N.

**1-(3,3,3-Triphenylpropyl)-4-(5-dimethylcarbamido-2-pyrimidyl)piperazine (38).** 1-(3,3,3-Triphenylpropyl)-4-(5-chlorocarbonyl-2-pyrimidyl)piperazine (15 g, 0.0281 mole) (mp 214°) was gradually added to a solution of 0.1124 mole of Me<sub>2</sub>NH in anhydrous PhH at room temperature. The mixture was heated under reflux for 1 hr. After cooling, it was treated with H<sub>2</sub>O (50 ml) and decanted. The organic portion was evaporated *in vacuo* and the syrupy residue was dissolved in hot EtOH (50 ml). After cooling, the crystals were filtered off and washed with cold EtOH: yield, 10 g (70.4%); mp (MK) 155–157°. The starting chloride was prepared by chlorination of 37 in excess SOCl<sub>2</sub>.

**1-(3,3,3-Triphenylpropyl)-4-(4-allylamino-5-amino-2-pyrimidyl)piperazine (50).** A solution of 56 g (0.104 mole) of 1-(3,3,3-triphenylpropyl)-4-(4-allylamino-5-nitro-2-pyrimidyl)piperazine (mp 176°) in 3 l. of MeOH was stirred under 7 kg/cm<sup>2</sup> of H<sub>2</sub> over 20 g of Raney-Ni. After completion of the hydrogenation, the catalyst was removed and the solvent was evaporated *in vacuo*. The resinous purple residue (45 g) was dissolved in anhydrous MeOH (600 ml) and the solution saturated with HCl gas. The crude dihydrochloride crystallized, and after cooling was filtered off: yield, 42.5 g; mp (cap) 220–222°. It was dissolved in H<sub>2</sub>O (250 ml) and the base was precipitated, with cooling to 0°, with 4 *N* NaOH (100 ml), collected on a filter, washed with H<sub>2</sub>O, and dried in air. The crude product (31 g) was recrystallized in MeCN (300 ml): yield, 23 g (43.5%); mp (cap) 150–152°. The starting material was prepared according to method A from 2-chloro-4-allylamino-5-nitropyrimidine: yield 97%. *Anal.* ( $C_{32}N_4O_2$ ) C, H, N.

A series of 2-(4-aryl-1-piperazinyl)bicyclo[3.3.1]nonan-9-ones were synthesized and some of them were converted to the 9-phenyl-9-hydroxy derivatives. In most CNS models, 2-(4-phenyl-1-piperazinyl)-9-phenylbicyclo[3.3.1]nonan-9-ol (**17**) was found to exhibit an activity pattern similar to chlordiazepoxide.

It has been reported that 2-substituted-4-phenyl-1-piperazinylmethyl cycloalkanones possess analgetic and antiinflammatory activity in laboratory animals.<sup>1</sup> These findings prompted the synthesis of a number of analogous bicyclic Mannich bases having the general structure I where

R = H or lower alkyl, R<sub>1</sub> = H or Ph, n = 1-3, and B = tertiary amino.

In initial general studies it was noted that 2-(4-phenyl-1-piperazinyl)bicyclo[3.3.1]nonan-9-one (**4**) had the property of inducing catalepsy in the rat. Since this effect is an indicator of potential tranquilizing activity, it was decided to further investigate this bicyclic structure where the 2-(4-aryl-

1-piperazinyl) moiety is an integral part of the ring system. This paper is primarily concerned with the synthesis and CNS pharmacological properties of 2-(4-aryl-1-piperazinyl)-bicyclo[3.3.1]nonan-9-ones and derivatives thereof.

The compounds in Table I were prepared by the method of Stork and Landesman.<sup>2</sup> The fact that enamines derived from cyclohexanone and higher molecular weight amines reacted with acrolein in inert solvents to give crystalline 8a-amino-4a,5,6,7,8,8a-hexahydro-4H-1-benzopyrans (**II**) has been reported previously.<sup>3</sup> These intermediates could be isomerized to the bicyclic ketones by heating in DMF-Et<sub>3</sub>N; it was later found that heating in 2-PrOH-Et<sub>3</sub>N resulted in cleaner isomerization of the intermediate.

In the case of the isomerization of **II** (B = 4-phenyl-1-piperazinyl; R = R<sub>1</sub> = H), we showed that the stereochemical results were formation of **III** and **IV** in a ratio of approximately 4:1.<sup>3</sup> These results are consistent with those reported by Dean, *et al.*,<sup>4</sup> who determined the stereochemistry of the amino ketones formed in the reaction of 1-morpholinocyclohexene with acrolein.
