Azines are prepared from keto-functionalized thiocrown ethers; a diketo example reacts intramolecularly.

Macrocyclic thioether ligands have, in principle, the potential to work as extraction agents for soft, heavy-metal ions. Silver, copper, cadmium and mercury display especially strong affinities with the proximate sulfur ligating sites of thiocrown ethers. ${ }^{1-6}$ The possibility of using these ligands as sequestering 7,8 agents in, for example, treatment of heavy-metal poisoning, prompted us to study the functionalization of the molecular periphery of the crown ether system.9,10 The syntheses of $\mathbf{1}$ and 2 depicted in Scheme 1 illustrate routes developed to simple mono- and di-functionalized thiocrown ethers. ${ }^{10,11}$ Further functionalization should be possible via the methylene and keto groups. We describe here a specific type of functionalization of the keto-substituted macrocycles $\mathbf{1 a}$ and $\mathbf{2 a}$ as well as $\mathbf{3}$ and $\mathbf{4}$ prepared following route (a) given in Scheme 1.

Preliminary experiments with $\mathbf{3}$ and $\mathbf{4}$ in which additions to the carbonyl group were attempted (Wittig, Grignard reagents) were disappointing owing to the high tendency towards enolization. On the other hand, condensation of 1a, $\mathbf{3}$ and $\mathbf{4}$ with hydrazine proceeded smoothly in 38 to $57 \%$ yields
to provide the symmetrical azines $5-7 .+$ The hydrazides were not characterized but are doubtless intermediates. No evidence for tautomerization of the imine functionalities was found. Analytical and spectral data are in accordance with the suggested structures.
Although these azines are crystalline, the hair-like crystal shape hampered efforts to determine the molecular structure

[^0]

7
by X-ray diffraction methods. The mixed oxygen-sulfur crown azine 6 eventually provided suitable crystals. $\ddagger$ The molecular structure of $\mathbf{6}$ is illustrated in Fig. 1.

The molecule is built up of two macrocyclic ring fragments interconnected as expected by the azine bridge. It possesses a twofold symmetry axis in the middle of the $\mathrm{N}-\mathrm{N}$ bond vector. The bis-imine unit is bent from a coplanar anti arrangement as is indicated by the $\mathrm{C}\left(3^{\prime}\right)-\mathrm{N}(14)-\mathrm{N}\left(14^{\prime}\right)$ torsion angle of $139.88^{\circ}$. This nonplanar arrangement is also found in aromatic (ket)azines like those of benzaldehyde and $p$-salicylaldehyde and in the azine of butane-2,3-dione. ${ }^{12-15}$
The N-N bond distance $[1.406(3) \AA$ ] is fairly normal and compares well with those found for the azines of benzaldehyde $[1.38(1) \AA]^{15}$ and $p$-salicylaldehyde [1.417(7) $\left.\AA\right] .{ }^{14}$

The macrocyclic ring is twisted with respect to this plane $[\mathrm{S}(1)-\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{N}(14)=-80.5(3), \mathrm{S}(5)-\mathrm{C}(4)-\mathrm{C}(3)-\mathrm{N}(14)$ $\left.=96.0(3)^{\circ}\right]$. As a result of this rather open arrangement of

[^1]

Fig. 1 Perspective plot of 6 . Selected bond distances $(\AA)$ and (torsion) angles $\left({ }^{\circ}\right): \mathrm{N}(14)-\mathrm{N}(14 \mathrm{a}) 1.4055(3), \mathrm{S}(1)-\mathrm{C}(2) 1.829(3), \mathrm{N}(14)-\mathrm{C}(3)-$ $\mathrm{C}(2) \quad 125.6(2), \quad \mathrm{S}(5)-\mathrm{C}(6)-\mathrm{C}(7)-\mathrm{O}(8) \quad 64.1(3), \quad \mathrm{N}(14)-\mathrm{C}(3)-\mathrm{C}(4)$ $117.0(3), \mathrm{S}(1)-\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{N}(14) 80.5(3), \mathrm{O}(8)-\mathrm{C}(9)-\mathrm{C}(10)-\mathrm{O}(11)$ $65.0(3), \mathrm{C}(3)-\mathrm{N}(14)-\mathrm{N}(14 \mathrm{a}) 113.9(3), \mathrm{C}(4)-\mathrm{S}(5)-\mathrm{C}(6) 100.6(1)$.

Scheme 2 Reagents: i, $\mathrm{NH}_{2} \mathrm{NH}_{2} ; p$-TosOH
both macrocyclic units, the ligand will probably display two independent coordination sites.
The pronounced tendency of thiocrown ethers possessing ethylenic, propylenic, and propanone bridges to place all the sulfur atoms anti is revealed here also. ${ }^{1}$ The rigid three carbon bridge $\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{C}(4)$ (constituting part of the bis-imine unit) separates the two sulfur atoms $S(1)$ and $S(5)$ in an anti arrangement as is best reflected by the distances of $S(1)$ and $\mathrm{S}(5)$ from the plane defined by $\mathrm{C}(2)-\mathrm{C}(3)-\mathrm{C}(4)-\mathrm{N}(14)$ [distance plane $\mathrm{CCCN}-\mathrm{S}(1)=1.712 \AA$ and $\mathrm{CCCN}-\mathrm{S}(5)=1.728$ $\AA\rfloor$. The oxygen atoms $O(8)$ and $O(11)$ deviate somewhat from the pure gauche conformation about the dimethylene bridge $\mathrm{C}(9)-\mathrm{C}(10)\left[\mathrm{O}(8)-\mathrm{C}(9)-\mathrm{C}(10)-\mathrm{O}(11)=65.0^{\circ}(3)\right]$.
With 2a, an intramolecular, transannular condensation takes place with hydrazine hydrate. The reaction, as depicted in Scheme 2, proceeds smoothly in toluene with a catalytic quantity of toluene-p-sulfonic acid. The overall yield of the reaction to provide the unusual molecule $\mathbf{8}$ is approximately $15 \%$, suggesting that oligo- and poly-meric azines are formed competitively. § However, the experimental conditions for the synthesis of $\mathbf{8}$ have not been fully optimized.
§ A solution of $\mathbf{2 a}$ in toluene was allowed to react with an equimolar amount of $\mathrm{NH}_{2}-\mathrm{NH}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ and a catalytic amount of $p$-TosOH in toluene. This was refluxed with a Dean-Stark trap for 24 h . The mixture turned slowly reddish. After cooling, the solvent was removed in vacuo and the residual solid was chromatographed over silica gel using methylene chloride as eluent. The organic layer was evaporated leaving a tarry orange-red solid, which was difficult to purify; yield $15 \%$ based on diketone 2a. Exact mass $\mathrm{m} / \mathrm{z}=412.742$ (theor. 412.743 for $\mathrm{C}_{14} \mathrm{H}_{24} \mathrm{~S}_{6} \mathrm{~N}_{2}$ ).

Fig. 2 Thermal motion ellipsoid ( $50 \%$ probability level) pıot of 8 . Selected bond distances ( $\AA$ ) and angles $\left({ }^{\circ}\right): \mathrm{N}(\mathrm{a})-\mathrm{N} \quad 1.356(10)$, $\mathrm{N}-\mathrm{C}(1)-\mathrm{C}(2)-\mathrm{S}(1)-121.3(8), \mathrm{S}(1)-\mathrm{C}(3)-\mathrm{C}(4)-\mathrm{S}(2)-175.2(4), \mathrm{S}(2)-$ $\mathrm{C}(5)-\mathrm{C}(6)-\mathrm{S}(3) \quad 175.7(4), \mathrm{S}(3 \mathrm{a})-\mathrm{C}(7)-\mathrm{C}(1)-\mathrm{N}-105.9(8), \mathrm{C}(1 \mathrm{a})-$ $\mathrm{N}(\mathrm{a})-\mathrm{N}-\mathrm{C}(1) 180.0, \mathrm{~N}(\mathrm{a})-\mathrm{N}-\mathrm{C}(1) 111.8(7), \mathrm{C}(7)-\mathrm{C}(1)-\mathrm{N} 113.9(9)$.

The miviccuiar structure of 8 was determined by X-ray diffraction methods $\uparrow$ and is shown in Fig. 2.

The molecule possesses a centre of symmetry and is slightly twisted $\left[\mathrm{N}-\mathrm{C}(1)-\mathrm{C}(2)-\mathrm{S}(1)=-121.3(8)^{\circ}, \mathrm{S}(3 \mathrm{a})-\mathrm{C}(7)-\mathrm{C}(1)-\right.$ $\left.\mathrm{N}=-105.9(8)^{\circ}\right]$. It shows the same essential features as observed for the bis(keto) derivative $\mathbf{2} \mathbf{a}^{11}$ and other large ring systems. The sulfur atoms are arranged in an anti fashion as is evident from the $S-C-C-S$ torsion angles $S(1)-C(3)-C(4)-$ $S(2)=-175.2(4)^{\circ}, S(2)-C(5)-C(6)-S(3)=175.7(4)^{\circ}$.

IT Crystal data for 8: $\mathrm{C}_{14} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{~S}_{6}: M_{\mathrm{r}}=412.75$, block-shaped yellowish crystal $(0.12 \times 0.25 \times 0.25 \mathrm{~mm})$ orthorhombic, space group $P b c a$ with $a=12.030(2), b=9.270(1), c=16.856(5) \AA, V=1879.7(7)$ $\AA^{3}, Z=4, D_{\mathrm{c}}=1.458 \mathrm{~g} \mathrm{~cm}^{-3} ; 7629$ reflections $\left(\theta<26^{\circ}, \omega / 2 \theta\right.$ scan, $T$ 150 K ) were measured on a CAD 4T/ rotating anode diffractometer using graphite monochromated $\mathrm{Mo}-\mathrm{K} \alpha$ radiation ( $\lambda=0.71073 \AA$ ). Data were corrected for $L p$, a small linear decay of $7 \%$ and absorption (DIFABS). The structure was solved by direct methods (SHELXS86) and refined by full-matrix least-squares (SHELXS-76) to $R=$ $0.078\left(R_{\mathrm{w}}=0.064\right) \mathrm{w}^{-1}=\sigma^{2}(F)+0.000084 F^{2}, 1038$ reflections with $I$ $>3 \sigma(I) ; 125$ parameters. H-atoms were located from a difference Fourier map and their positions refined. For 6 and 8, atomic coordinates, bond lengths and angles, and thermal parameters have been deposited at the Cambridge Crystallographic Data Centre. See Notice to Authors, Issue No. 1.

As a result of the internal $\mathrm{N}-\mathrm{N}$ bond $[\mathrm{N}(\mathrm{a})-\mathrm{N}=1.356$ (10) $\AA$ ], the molecule is more or less folded. This closely resembles the arrangement of $2 \mathbf{a}^{11}$ in which the two carbonyl moieties point inward into the molecular cavity ${ }^{11}$ of the macrocycle.

We envisage the possibility to prepare new classes of cryptand-like systems by condensation reactions with primary $\alpha, \omega$-diamines. The intermolecular reactions with two separate macrocycles provide an entry into ditopic receptors. Further work is in progress and will be presented in forthcoming papers.
