

*Structure of the C₈-Base, an Acid
Degradation Product of Tetrodotoxin*

By Toshio GOTO, Yoshito KISHI
and Yoshimasa HIRATA

(Received May 1, 1962)

Alkaline degradation of tetrodotoxin¹⁾ (swell-fish poison) afforded a yellow compound (C₉-base), whose structure was reported in the previous communication²⁾. Tetrodotoxin also gave another yellow compound (C₈-base) when treated with sulfuric acid. That the C₈-base is 2-amino-6-hydroxyquinazoline (I) is deduced from the following evidences.

Tetrodotoxin was dissolved in concentrated sulfuric acid and the solution allowed to stand at room temperature for three days. Then the reaction mixture was neutralized with aqueous barium hydroxide and filtered. The filtrate was acidified with hydrochloric acid, evaporated to dryness under vacuum, and the residue was sublimed to give the C₈-base hydrochloride, m. p. over 250°C (in a sealed tube). Treatment of the hydrochloride with acetic anhydride and pyridine afforded the diacetate (II), m. p. 198°C (in a sealed tube), C₈H₅ON₃(COCH₃)₂ (Found: C, 58.64; H, 4.55; N, 17.31. Calcd.: C, 58.77; H, 4.52; N, 17.14%); $\lambda_{\max}^{\text{EtOH}}$ m μ (log ϵ): 248 (4.3), $\lambda_{\max}^{\text{NaOH-EtOH}}$ 258 (4.1); ν_{KBr} 1745 (phenol ester), 1675 cm⁻¹ (amide).

2-Amino-4-methyl-6-hydroxyquinazoline (III) was synthesized for comparison of its ultraviolet spectrum with that of the C₈-base. 2-Nitro-5-hydroxyacetophenone³⁾, m. p. 146~147°C, was reduced catalytically (H₂/PtO₂) to give 2-amino-5-hydroxyacetophenone, m. p. 183~187°C (decomp.), which was then condensed with cyanamide. The quinazoline III thus obtained was converted to its hydrochloride, m. p. over 250°C (in a sealed tube). The ultraviolet spectrum of the C₈-base hydrochloride [$\lambda_{\max}^{\text{H}_2\text{O}}$ m μ (log ϵ): 233 (4.3), $\lambda_{\max}^{\text{NaOH}}$ 245 (4.4)] was almost superimposable with that of the quinazoline III hydrochloride [$\lambda_{\max}^{\text{H}_2\text{O}}$ m μ (log ϵ): 233 (4.3), $\lambda_{\max}^{\text{NaOH}}$

245 (4.4)]. For a methyl substituent at C₄-position would not contribute much to the ultraviolet spectrum of the quinazoline III, the C₈-base must have the structure I. The NMR spectrum of C₈-base in deuterium oxide shows only three signals (all singlets) at -2, -23 and -73 c. p. s.⁴⁾ (area ratio 1:2:1), which were assigned to one proton at C₄, two at C₇ and C₈, and one at C₅, respectively.

The author wish to thank Fujisawa Pharmaceutical Co. Ltd., for collecting ovaries of swellfish and to express appreciation to the Public Health Service, National Institutes of Health, for support of this work under Research Grant RG-7969.
