TABLE 1. Diels-Alder reactions of lactone ester 2

Entry	Diene ^a	Time(h) ^b	Adduct(s) (ratio)	% Yield
1		6	 5	91
2		3	 6	86
3		0.25	 7 + 8 (20:1) ^d	100
4		24	 9 + 10 (7:3) ^e	75
5		22	 11	93
6		24 ^c	 12 + 13 (4:1) ^f	60
7		19	 14	89

^aIn each case 20 equiv. of diene was used except for that of 1-acetoxy-1,3-butadiene in which 10 equiv. was used.^bUnless otherwise specified, reactions were performed in ether at ambient temperature using stannic chloride (0.5 equiv.) as a catalyst.^cThis reaction was carried out at 0°C using 1 equiv. of stannic chloride.^dSeparation was effected by column chromatography on silica gel.^eSeparation was effected by flash chromatograph (12).^fInseparable mixture was obtained. The ratio was based on the ¹Hmr spectrum of the mixture.^gA single product was obtained, the stereochemistry of which could not be readily assigned.

(*ortho* and *para*) governing the orientation of Diels-Alder addition (1). In cases where differing secondary orbital overlap (13) would affect the stereochemistry of the adducts (Entries 3–6), experimental results showed a strong preference of the diene to overlap with one carbonyl over the other.

Several aspects of the structural assignments should be discussed. With respect to the orientation of the adducts derived from unsymmetrical dienes, assignments in cases of 9–13 were easily

made since in each case the signal which was readily assigned to the ring junction proton appeared as a doublet of doublets in the ¹Hmr indicating the presence of two protons on the adjacent carbon. Assignment of the regiochemistry of adduct 6 was concluded after comparison of the ¹³Cmr spectrum with those of the structurally related compounds 15 and 16, the structures of which have been rigorously established (7). The adduct 6 showed two triplets at δ 28.1 and 27.1 for the two carbocyclic methylene carbons similar to the cor-

responding carbons (δ 29.0 and 28.7) in compound **15** and in marked contrast to the signals at δ 33.1 and 24.2 observed in isomer **16**.

With regard to the stereochemical assignments, the ring junction stereochemistry of all the adducts follows from the *cis*-principle (1) for which no violations have been observed. The complete stereochemistry of cyclopentadiene adducts **7** and **8** was further deduced as follows. Examination of Dreiding models showed the lactone ring junction proton should be shielded by the double bond in structure **7** while in structure **8** this proton should not be affected (14). Examination of the ^1Hmr spectrum of the major adduct showed a signal at δ 2.37 which was assignable to the ring junction proton while the corresponding proton in the minor isomer showed a relatively normal shift of δ 2.92 (δ 2.66–3.29 for other compounds in this series). In cases of adducts **9**–**13** which are conformationally flexible, the complete stereochemistry could not be assigned without ambiguity by spectroscopic analysis. A number of chemical methods were attempted³ but were not successful. The depicted stereochemistry of these compounds was tentatively assigned based mainly on the results obtained for cyclopentadiene, which indicated that the Diels–Alder reaction proceeded with a preferential secondary overlap of the diene with the ester carbonyl rather than the lactone carbonyl.

This report enlarges the scope of application of Diels–Alder reactions to the synthesis of lactone-containing systems and further demonstrates the advantage of using an activated dienophile to prepare useful adducts from relatively less reactive dienophile systems. A simple application of this particular dienophile (**2**) to the synthesis of natural products is illustrated by the two-step synthesis of

o-mentha-1,3-dien-1→8-olide (**20**), a monoterpene lactone isolated from the urine of the koala bear (*Phascolarctos cinereus*) (**15**). The mixture of the epimeric acetoxy lactones **12** and **13**, prepared in 60% yield from **2** and 1-acetoxy-1,3-butadiene, was treated with lithium iodide dihydrate in collidine at reflux for 1 h. Racemic *o*-menthane lactone **20** was isolated in 50% yield and showed spectroscopic properties identical to those reported for the levorotatory natural compound (**15**).

Experimental

General

Melting points were determined on a Kofler hot stage apparatus and are uncorrected. Elemental analyses were performed by the microanalytical laboratory of this department. The ir spectra were recorded on a Nicolet 7-199 FT-IR spectrophotometer and, except where otherwise stated, were obtained on solutions in chloroform. The ^1Hmr spectra were recorded on a Varian HA-100, Bruker WH-200, or WH-400 spectrometer and, except where otherwise stated, were obtained on solutions in carbon tetrachloride with tetramethylsilane as internal reference. The ^{13}Cmr spectra were recorded on a Bruker WP-60/Nicolet BNC-12 system or a Bruker WH-400 spectrometer and were obtained on solutions in deuteriochloroform using tetramethylsilane as internal reference. Mass spectra (ms) were recorded using A.E.I. model MS12 or MS50 mass spectrometers. Unless stated otherwise, anhydrous magnesium sulfate was used for drying organic solutions.

Ethyl 4-bromo-2-carbethoxy-4-methyl-2-pentenoate (**4**)

Diester **3** (5.14 g, 24 mmol) was dissolved in carbon tetrachloride (50 mL) under an argon atmosphere and *N*-bromosuccinimide (4.7 g, 26.4 mmol) was added followed by benzoyl peroxide (100 mg, 0.41 mmol). The mixture was heated at reflux for 1 h, cooled to room temperature, filtered, and concentrated to give the crude bromo ester **4** (7.55 g). A portion of this material (1.114 g) was purified by column chromatography on silica gel. Elution with 15% ether in petroleum ether gave pure bromo ester **4** (936 mg; 91% yield); ir: 1733 (C=O) and 1643 (C=C) cm^{-1} ; ^1Hmr δ : 6.95 (s, 1H, —CH=), 4.20, 4.18 (both q, 2H each, $J = 7$ Hz each, $2 \times -\text{OCH}_2-$), 1.91 (s, 6H, $2 \times -\text{CH}_3$), 1.31, and 1.29 (both t, 3H each, $J = 7$ Hz each, $2 \times -\text{OCH}_2\text{CH}_3$). Anal. calcd. for $\text{C}_9\text{H}_{12}\text{O}_3\text{Br}$: C 45.07, H 5.85, Br 27.26; found: C 45.06, H 5.93, Br 27.44.

3-Carbethoxy-5,5-dimethyl-2(5H)-furanone (**2**)

Crude bromo ester **4** (2.84 g, ~ 9.7 mmol) was dissolved in

³In one approach, both compounds **9** and **10** were converted, via bromide **17**, to diene **18** (>60% yield; ir (neat): 1768, 1742, 1729, 1640, 1600, and 1995 cm^{-1} ; ^1Hmr (CDCl_3) δ : 5.84–6.18

(complex, 2H, —C=CH—CH=), 5.55 (dd, 1H, $J = 8$, $J' = 6$ Hz, —CH—CH—), 4.15 (q, 2H, $J = 7$ Hz, —OCH₂—), 3.38 (d, 1H, $J = 6$ Hz, —CH—), 1.94 (s, 3H, —C—CH₃), 1.47 (s, 3H, —CH₃), 1.21 (t, 3H, $J = 7$ Hz, —OCH₂CH₃), and 1.18 (s, 3H, —CH₃); ms M^+ 250.1202 (calcd. for $\text{C}_{14}\text{H}_{18}\text{O}_4$: 250.1203) by allylic bromination (*N*-bromosuccinimide (1 equiv.) and α,α' -azodiisobutyronitrile (trace) in refluxing carbon tetrachloride; 1 h) and dehydrobromination (1,5-diazabicyclo[4.3.0]non-5-ene in refluxing benzene; 8 h). In an attempt to prepare compound **19** to compare with the dihydro-derivative of **9** or **10**, catalytic hydrogenation of **18** resulted only in the saturation of the disubstituted double bond even under severe conditions (e.g. Pt in EtOAc; H₂; 1500 psi). The transformation of **9** and **10** to the same diene **18** nevertheless serves to confirm their epimeric relationship and orientation.

tetrahydrofuran (50 mL) and water (25 mL). Silver oxide (2.48 g, 10.67 mmol) was added. After stirring for 48 h at room temperature, the reaction mixture was filtered and tetrahydrofuran was removed under reduced pressure. The aqueous solution was extracted with methylene chloride. The extracts were washed with water, dried, and concentrated. Column chromatography on silica gel eluting with 50% ether in petroleum ether gave lactone ester 2 (1.12 g; 67% yield from diester 3); mp 68–70°C (ether); ir: 1763 (C=O), 1714 (C=O), and 1638 (C=C) cm^{-1} ; ^1Hmr δ : 8.06 (s, 1H, $-\text{CH}=\text{CH}-$), 4.24 (q, 2H, $J = 7$ Hz, $-\text{OCH}_2\text{CH}_3$), 1.52 (s, 6H, $2 \times -\text{CH}_3$), and 1.35 (t, 3H, $J = 7$ Hz, $-\text{OCH}_2\text{CH}_3$); ^{13}Cmr δ : 167.1, 160.4, 124.6, 83.5, 61.7, 25.0, and 14.1; ms M^+ 184.0744 (calcd. for $\text{C}_9\text{H}_{12}\text{O}_4$: 184.0735). *Anal.* calcd. for $\text{C}_9\text{H}_{12}\text{O}_4$: C 58.69, H 6.57; found: C 58.76, H 6.66.

A less expensive method was found to be the pyrolytic cyclization of the crude bromo ester 4. Lactone ester 2 was produced directly on attempted distillation of 4 (70.8 g) at 1 Torr. The fraction collected at 128°C was pure lactone ester 2 (15.9 g). Additional 2 (4.8 g) was obtained by column chromatography of the combined lower boiling fractions (102–120°C). The total yield was 51% from diester 3.

Diels–Alder reactions of lactone ester 2

The reactions were carried out using the general procedure illustrated below with 2,3-dimethyl-1,3-butadiene. Temperature and time of reactions as well as quantities of dienes and stannic chloride relative to 2 are noted in Table 1.

Lactone ester 2 (500 mg, 2.71 mmol) was dissolved in ether (25 mL) under an argon atmosphere. The solution was chilled to 0°C and stannic chloride (354 mg, 1.36 mmol) was added. A dense white precipitate was observed immediately. After 5 min, 2,3-dimethyl-1,3-butadiene (6.13 mL, 54.3 mmol) was added and stirring was continued for 6 h at room temperature. Water (20 mL) was added and the resulting mixture was extracted with methylene chloride. The extracts were washed with water, dried, filtered, and concentrated. Column chromatography on silica gel eluting with 10–20% ether in petroleum ether gave adduct 5 (657 mg; 91% yield); ir: 1769 (C=O) and 1736 (C=O) cm^{-1} ; ^1Hmr δ : 4.16 (q, 2H, $J = 7$ Hz, $-\text{OCH}_2-$), 2.84 (dd, 1H, $J = 7$, $J' = 3$ Hz, $-\text{CH}-$), 2.63, 2.22 (both d, 1H each, $J = 16$ Hz each, $-\text{CH}_2-$), 1.78–2.12 (complex, 2H, $-\text{CH}_2\text{CH}-$), 1.68 (s, 6H, $2 \times -\text{CCH}_3$), 1.43 (s, 3H, $-\text{CH}_3$), 1.28 (t, 3H, $J = 7$ Hz, $-\text{OCH}_2\text{CH}_3$), and 1.24 (s, 3H, $-\text{CH}_3$); ^{13}Cmr δ : 174.6, 171.0, 125.4, 125.1, 85.9, 62.1, 56.2, 47.3, 34.5, 30.1, 29.4, 23.9, 19.0, 18.8, and 14.0; ms M^+ 266.1516 (calcd. for $\text{C}_{15}\text{H}_{22}\text{O}_4$: 266.1518). *Anal.* calcd. for $\text{C}_{15}\text{H}_{22}\text{O}_4$: C 67.65, H 8.33; found: C 67.37, H 8.36.

The adducts 6–14 showed the following spectral data.

Compound 6; mp 43–44°C (ether – petroleum ether); ir: 1767 (C=O) and 1736 (C=O) cm^{-1} ; ^1Hmr δ : 5.46 (m, 1H, $-\text{CH}=\text{CH}-$), 4.18 (q, 2H, $J = 7$ Hz, $-\text{OCH}_2-$), 2.98 (dd, 1H, $J = 7$, $J' = 2$ Hz, $-\text{CH}-$), 2.87, 2.22 (both md, 1H each, $J = 14$ Hz each, $-\text{CHCH}_2-$), 1.84–2.12 (complex, 2H, $-\text{CH}_2\text{CH}-$), 1.72 (s, 3H, $-\text{CH}_3$), 1.46 (s, 3H, $-\text{CH}_3$), 1.29 (t, 3H, $J = 7$ Hz, $-\text{OCH}_2\text{CH}_3$), and 1.24 (s, 3H, $-\text{CH}_3$); ^{13}Cmr δ : 174.6, 170.6, 133.2, 118.4, 86.0, 62.1, 53.5, 46.6, 29.8, 28.1, 27.1, 23.4, 23.2, and 14.0; ms M^+ 252.1368 (calcd. for $\text{C}_{14}\text{H}_{20}\text{O}_4$: 252.1361). *Anal.* calcd. for $\text{C}_{14}\text{H}_{20}\text{O}_4$: C 66.65, H 7.99; found: C 66.76, H 8.28.

Compound 7; ir: 1761 (C=O) and 1726 (C=O) cm^{-1} ; ^1Hmr δ : 6.13–6.34 (complex, 2H, $-\text{CH}=\text{CH}-$), 4.16 (q, 2H, $J = 7$ Hz, $-\text{OCH}_2-$), 3.38 (m, 1H, $-\text{CHCH}_2-$), 3.01 (br s, 1H, $-\text{CHCHCH}_2-$), 2.37 (s, 1H, $-\text{CH}-$), 1.54 (s, 3H, $-\text{CH}_3$),

(±)-*o*-Mentha-1,3-dien-1→8-olide (**20**)

Lithium iodide dihydrate – collidine reagent (1.28 N) was freshly prepared by the sequential addition of lithium iodide (514 mg, 3.84 mmol) and water (138 μL , 7.68 mmol) to 2,4,6-collidine (3.05 mL). A mixture of acetoxylactones **12** and **13** (152 mg, 0.51 mmol) was dissolved in this reagent (2.3 mL) under an argon atmosphere. The resulting solution was heated at reflux with stirring for 1 h. After cooling to room temperature, the reaction mixture was acidified with ice-cold 5% aqueous hydrochloric acid and extracted with ether. The extracts were washed with ice-cold aqueous hydrochloric acid and water, dried, filtered, and concentrated. Flash chromatography (12) of the residue on silica gel eluting with 5% ether in petroleum ether gave racemic *o*-menthane lactone **20** (42 mg; 50% yield); ir (neat): 1749 (C=O), 1664, and 1570 (C=C) cm^{-1} ; ^1Hmr (CDCl₃) δ : 6.89 (m, 1H, —C=CH—), 6.06–6.24 (complex, 2H, —CH=CH—), 2.98 (m, 1H, —CH—), 2.12–2.46 (complex, 2H, —CH₂—), 1.54 (s, 3H, —CH₃), and 1.36 (s, 3H, —CH₃); ms m/e : 164.0837 (M^+ ; 22.59%; calcd. for C₁₀H₁₂O₂: 164.0837), 106.0427 (95.21%; C₇H₆O), 105.0351 (100%; C₇H₅O), 78.0492 (43.03%; C₆H₆), and 77.0375 (20.35%; C₆H₅).
