Elution of the column with Et₂O gave 6.1 g (28%) of orange crystals, mp 64–66° Recrystallization (cyclohexane) gave light tan crystals of 3a,4,5,6-tetrahydro-3a-methyl-2-phenylcylco-pentapyrazol-3(2H)-one (**18**), mp 68–69°. Anal. (C₁₃H₁₄N₂O) C, H, N; ir, 5.85 μ (C=O); nmr (DMSO-d₆) τ 8.62 (s, 3, CCH₃), 8.44–7.16 (m, 6, CH₂), and 3.00–205 (5, phenyl).

Elution of the column with Et₂O-MeOĤ (4:1) gave 2.8 g (13%) of tan crystals, mp 123-127°. Recrystallization (EtOH) gave colorless crystals of 1,4,5,6-tetrahydro-1-methyl-2-phenylcyclopentapyrazol-3(2H)-one (**6**), mp 127-128° (lit.^{*} mp 128°). Anal. (C₁₃H₁₄N₂O) C, H, N; ir, 6.01 μ (C=O).

B. With Methyl *p*-Toluenesulfonate.—A solution of 2.0 g (0.01 mol) of 10, 20 ml of DMF, 0.44 g (0.01 mol) of 55% NaH dispersion, and 1.86 g (0.01 mol) of methyl *p*-toluenesulfonate was heated at 120° with stirring for 2 hr. The solution was cooled, diluted with 100 ml of H₂O, and extracted with Et₂O. The Et₂O solution was dried (MgSO₄) and concentrated to a brown oil which was chromatographed on silica gel. Eluted with cyclohexane–Et₂O (9:1) was 0.9 g (42%) of an oil. Short-path distillation at 115° (0.2 mm) gave 2,4,5,6-tetrahydro-3-methoxy-2-phenylcyclopentapyrazole (13) as a pale yellow. *Anal.* (C₁₃H₁₄-N₂O) C, H, N; nmr (DMSO-d₆) τ 6.04 (s, 3, OCH₃); ir (liq film), no CO band below 6.15 μ .

C. With Allyl Chloride.—A solution of 4.0 g (0.02 mol) of 10, 1.53 g (0.02 mol) of allyl chloride, 1.08 g (0.02 mol) of NaOMe, and 50 ml of EtOH was heated under reflux with stirring for 18 hr, and then concentrated to dryness. The residue was taken up in H_2O , and the mixture was extracted with Et_2O . The Et_2O solution was dried (MgSO₄) and concentrated to a yellow oil which was chromatographed on alumina.

Elution of the column with C_6H_6 gave 1.5 g (31%) of a yellow oil. Evaporative distillation at 110° (0.05 mm) gave 3a-allyl-3a,4,5,6-tetrahydro-2-phenylcylopentapyrazol-3(2*H*)-one (**19**) as a colorless oil. Anal. ($C_{15}H_{16}N_2O$) C, H, N; ir (liq film) 5.82 μ (C==O).

Elution of the column with Et₂O-MeOH (1:1) gave 1.0 g (21%) of brown crystals, mp 92–93°. Recrystallization (cyclohexane) gave tan crystals of 1-allyl-1,4,5,6-tetrahydro-2-phenylcyclopentapyrazol-3(2*H*)-one (**7**), mp 93–94°. Anal. (C₁₅H₁₆N₂O) C, H, N; ir, 6.04 μ (C=O).

Benzylation of 2-(p-Bromophenyl)-2,4,5,6-tetrahydrocyclopentapyrazol-3-ol (11),—A solution of 2.8 g (0.01 mol) of 11, 1.7 g (0.01 mol) of PhCH₂Br, 0.54 g (0.01 mol) of NaOMe, and 25 ml of EtOH was heated under reflux for 15 hr, and then concentrated to dryness. The residue was taken up in H₂O, and the mixture was extracted with Et₂O. The Et₂O solution was dried (MgSO₄) and concentrated to a yellow oil which was chromatographed on alumina.

Elution of the column with C_6H_6 gave 1.2 g (32%) of colorless crystals, mp 85–95°. Recrystallization (hexane) provided colorless crystals of 3a-benzyl-2-(*p*-bromophenyl)-3a,4,5,6-tetrahydrocyclopentapyrazol-3(2*H*)-one (**20**), mp 110–111°. Anal. ($C_{19}H_{17}$ BrN₂O) C, H, Br, N; ir, 5.83 μ (C=O).

Elution of the column with MeOH gave 1.0 g (27%) of tan crystals, mp 113–115°. Recrystallization (cyclohexane) gave colorless needles of 1-benzyl-2-(*p*-bromophenyl)-1,4,5,6-tetra-hydrocyclopentapyrazol-3(2*H*)-one (8), mp 117–118°. *Anal.* (C₁₉H₁₇BrN₂O) C, H, Br, N; ir, 5.98 μ (C==O).

Benzylation of 2-(p-Fluorophenyl)-2,4,5,6-tetrahydrocyclopentapyrazol-3-ol (12).—The procedure used for the benzylation of 11 was employed. From 2.2 g (0.01 mol) of 12, 1.7 g (0.01 mol) of benzyl bromide, 0.54 g (0.01 mol) of NaOMe, and 25 ml of EtOH was obtained an oil which was chromatographed on alumina.

Elution of the column with hexane-Et₂O (3:1) gave 0.09 g (3%) of colorless crystals, mp 75-76°. Recrystallization (hexane) provided colorless crystals of 3-benzyloxy-2-(*p*-fluorophenyl)-2,4,-5,6-tetrahydrocyclopentapyrazole (14), mp 77°. *Anal.* (C₁₉H₁₇ FN₂O) C, H, F, N; ir, no CO band below 6.20 μ .

Elution of the column with hexane-Et₂O (1:1) provided 0.51 g (17%) of colorless crystals, mp 90-94°. Recrystallization (hexane) gave colorless crystals of 3a-benzyl-2-(*p*-fluorophenyl)-3a,4,5,6-tetrahydrocyclopentapyrazol-3(2*H*)-one (**21**), mp 98-99°. Anal. (C₁₉H₁₇FN₂O) C, H, F, N; ir, 5.86 μ (C=O).

Elution of the column with Et₂O-MeOH (49:1) provided 0.83 g (27%) of yellow crystals, mp 90–92°. Recrystallization (cyclohexane) gave colorless crystals of 1-benzyl-2-(*p*-fluoro-phenyl)-1,4,5,6-tetrahydrocyclopentapyrazol-3(2*H*)-one (**9**), mp 112°. Anal. (C₁₉H₁₇FN₂O) C, H, F, N; ir, 6.00 μ .

2,4,5,6-Tetrahydro-3-methoxy-1-methyl-2-phenylcyclopenta-

pyrazolium Iodide (24).—A solution of 4.0 g (0.02 mol) of **13** and 6 ml of MeI was allowed to stand at room temperature for 15 hr. The solution was diluted with 200 of Et₂O and filtered to give 1.45 g (20%) of crystals, mp 108–110°. Recrystallization (MeOH-Et₂O) gave colorless crystals, mp 109–110° dec. Anal. ($C_{14}H_{17}IN_{2}O$) C, H, I, N.

Pyrolysis of 2,4,5,6-Tetrahydro-3-methoxy-1-methyl-2-phenyl-cyclopentapyrazolium Iodide (24).—A solution of 170 mg of 24 and 4 ml of MeOH was heated under reflux for 24 hr. Evaporation of the solvent left 87 mg of 6, mp 123–125°. Ir and the examination of the product failed to indicate the presence of 18.

Puromycin Analogs. Aminoacyl Derivatives of 9-(3'-Amino-3'-deoxy-β-D-arabinofuranosyl)adenine¹

LINDA V. FISHER, WILLIAM W. LEE, AND LEON GOODMAN

Life Sciences Division, Stanford Research Institute, Menlo Park, California 94025

Received January 5, 1970

Puromycin (1), an antibiotic with antitumor activity,² has been used as an important biochemical tool in the study of protein synthesis. Many structural analogs of 1 have been prepared in an effort to exploit the biological properties of the antibiotic. These include analogs where other aminoacyl groups replace the *p*-methoxyphenylalanine moiety of $1,^{3-5}$ compounds where the *p*-MeO of 1 is replaced by other substituents,⁶ the derivative where the 3'-aminoribofuranose of 1 is replaced by 3'-aminoglucopyranose,⁷ and the 2'-O-Ac derivative⁸ of 1. In an extension of these investigations, we have prepared a number of aminoacyl derivatives of 9-(3-amino-3-deoxy- β -D-arabinonofuranosyl)adenine (3),⁹ a 2' epimer of 2. See Table I.

The aminoacyl derivatives **4** of **3** were prepared by standard methods of peptide synthesis, the method of choice for each compound being dependent on the relative ease of formation and facility of purification from by-products. The choice of solvents was severely restricted by the low solubility of **3**, with DMF solvent mixtures generally being the most useful. As in the work of Baker, *et al.*,³ unblocked **3** could be used in these coupling reactions. In contrast, blocking of the OH groups was essential to successful aminoacylation of 1-(3-amino-3-deoxy- β -D-glucopyranosyl)uracil.¹⁰

The two coupling procedures used were A, the mixed anhydride method using isobutyl chloroformate¹¹

which are to nonogeneous product suitable for the next reaction. "Crystallization or reprecipitation solvents are: E, ethanol; E-W, ethanol-water: F, hydrogenolysis solvent of ethanol-acetic acid-water was evaporated and residue foam triturated with acetone isopropanol to give the analytical sample; G, ethyl acetate; M, methanol; W, water. "The specific rotation values are degrees followed by concentration ($\frac{c}{c}$) and solvent: P = pyridine, W = water, ME = methoxyethanol. "Thin-layer chromatography (tle) on silica gel utilized these solvent systems: A, CHCl_T-MEOH (1:1); B, *n*-PrOH-E40Ac-H40 (3:2:1); C, CHCl_3-MEOH (3:1). Paper chromatography utilized solvent D, *n*-BuOH-HOAc H40 (4:1:5), and E, $5^{+}c^{-}$ disodium hydrogen phosphate. "Product prepared by method B has $[\sigma] D = 3.2^{\circ}$. "Solvents present in nur spectrum." When the "-benzyl ester was removed first, the intermediate, 4, R = BOC-L-Glu, was obtained, while handly correctly for a solvate with 0.75 H20, but was not further characterized." A Softens at 155°. A This rotation, and other properties for the analytical sample of **1** with nuclean dist, the intermediate, 4, R = BOC-L-Glu, was obtained, while handly correctly for a solvate with 0.75 H20, but was not further characterized. "Softens at 155°." A flux relation, and other properties for the analytical sample of **1** with handly free Discussion). Other samples of **17** prepared from 2-1-Phe and 8 by methods A and B had [σ] D = -12.0° and - 11.4°, respectively (see Experimental Scienton). F and the mathematical from 2-1-Phe-1.1.4°, respectively (see Experimental Scienter). xed sex Section). ⁴ All compounds were analyzed for C, H, N.

and B, the dicyclohexylcarbodiimide (DCC)-N-hydroxysuccinimide (NHS) method.^{12,13} Representative examples of each of these methods are described in the Experimental Section. Attempts to use a water-soluble carbodiimide¹⁴ gave much less satisfactory results.

Racemization during certain of these peptide syntheses was a problem as shown by the significant differences in rotation of the blocked *D*-alanyl nucleoside 9 prepared by methods A and B. The product from method B gave the larger rotation difference from the 2alanyl compound 7 and we assume that this method caused less racemization. Method B has been shown to be especially good in maintaining optical purity.¹³ In method A, although DMF as the solvent for mixed anhydride formation induces racemization, it is safe for the reaction of a preformed mixed anhydride.¹¹ In preparing the dipeptide nucleoside 17, the rotation data were in accord with expectations that the coupling of N-benzyloxycarbonyl-L-phenylalanine with 8 was preferable to the coupling of N-benzyloxycarbonyl-L-phenylalanyl-L-alanine¹⁵ with **3** by method **A**.

Catalytic hydrogenolysis with 5% Pd-C was used generally to remove the blocking groups to afford the final nucleoside peptides, all obtained as solvated solids. HOAc was added to aid in the deblocking of the arginyl derivative 11. The blocked glutamyl nucleoside 15 was first hydrogenolyzed to remove the γ -benzyl ester, then the *t*-butoxycarbonyl group was removed by a brief treatment (5 min) with trifluoroacetic acid at room temperature. Trial experiments with the aminonucleoside 3 showed it to be stable in trifluoroacetic acid for brief periods; but after 1 hr there was a detectable decrease in the rotation and after 4 days considerable adenine had formed. The original plan to couple another amino acid to 16 was deferred when trifluoroacetic acid treatment of 15 gave a product that did not seem very tractable and when several of the nucleoside peptides 4 gave negative preliminary testing results.

All the aminoacyl derivatives and some of the intermediates (all compounds in Table I except 5, 7, 9, and 11) were screened for antitumor activity in the mouse leukemia L-1210 system by Chemotherapy, National Cancer Institute, according to its protocol.¹⁶ These compounds were inactive at a dose of 400 mg/kg per day.

Experimental Section¹⁷

9-[3-Deoxy-3-(N-benzyloxycarbonyl-L-phenylalanyl-L-alanylamino)- β -D-arabinofuranosyl)adenine (17).—A solution of 90

(16) Cancer Chemother. Rep., 25, 1 (1962).

(17) Melting points were determined on a Fisher-Johns apparatus and are corrected. Optical rotations were measured at ambient temperatures with a Perkin-Elmer Model 141 automatic polarimeter. Paper chromatograms were run by the descending technique on Whatman No. 1 paper. Tlc was run on silica gel HF (E. Merck AG Darmstadt). The solvent systems are listed in Table I. All spots were detected by uv light and also sometimes with ninhydrin spray. All solutions were dried with MgSO4 (anhyd) and were coned *in vacuo* with a bath temp of less than 50° unless otherwise noted. Celite is a diatomaceous earth product of Johns-Manville. Samples were dried *in vacuo* (<1 mm) at 56° for 15 hr before analysis. Analytical results are within $\pm 0.4\%$ of the calculated values. mg (0.27 mmol) of the alanyl nucleoside 8, 81 mg (0.27 mmol) of N-benzyloxycarbonyl-L-phenylalanine and 31 mg (0.27 mmol) of N-hydroxysuccinimide in 2 ml of dry DMF was stirred and cooled in an ice-salt bath. To this was added 55 mg (0.27 mmol) of DCC. The mixture was stirred for 2 hr at room temp, cooled, diluted with 2 ml of water, and filtered to remove the dicyclohexylurea. The filtrate was evapd to dryness in vacuo, partitioned between 15 ml of EtOAc-BuOH (2:1) and 10 ml of H_2O , the H_2O being reextracted with 5 ml more of the organic solvents. The combined organic phase was washed several times with 10% KHCO3 solution, once with H2O, dried, and evapd in vacuo to give 69% of a homogeneous (by tlc) This was taken up in a hot solution of 20 ml of H_2O solid foam. and 4 ml of MeOH, filtered, and the filtrate allowed to cool. There was deposited 64 mg (41%) of a white amorphous solid which, after drying, had $[\alpha]^{22}D - 11.4^{\circ}$ (c 1.00, pyridine), and other properties like those listed in Table I for 17 prepared by other procedures.

9-[3-(Benzyloxycarbonyl-p-methoxyphenyl-L-alanylamino)-3deoxy- β -D-arabinofuranosyl]adenine (19).—Using the procedure suggested by Anderson, et al.,11 the mixed anhydride was prepared from 2.5 ml (18.2 mmol) of Et₃N, 2.4 ml (18.2 mmol) of isobutyl chlorocarbonate, 40 ml of EtOAc, and 5.97 g (18.2 mmol) of N-benzyloxycarbonyl-p-methoxyphenyl-L-alanine¹⁸ in an ice-salt bath, and stirred for 15 min. Meanwhile, 3.3 g (12.5 mmol) of the aminonucleoside 3 was dissolved by warming in 110 ml of dry DMF. This solution was cooled, added to the mixed anhydride in EtOAc and the mixture was stored at ca. 4° for 27 hr. The mixture was filtered, washed with 10 ml of DMF, and the combined filtrates evapd to dryness in vacuo. The residue was treated with 20 ml of $\dot{H_2O}$ and again evapd to a gummy solid. This was triturated with 150 ml of H_2O , then with 50 ml of Et₂O to afford 7.5 g of a white solid, $R_{\rm f}$ 0.50 in solvent C (tlc) with four trace spots of contaminants. Recrystallization from MeOH (800 ml coned to 350 ml and chilled) afforded, after washing with 30 ml of Et₂O, 4.5 g of white solid, mp 231-238° (62% yield), homogeneous by the with $R_{\rm f}$ 0.5 in solvent C. One more MeOH crystallization of similar material from an earlier run gave the anal sample of 19, mp 240-243°; other properties in Table I.

9-[3-Deoxy-3-(L-phenylalanylamino)- β -D-arabinofuranosyl]adenine (6).—A solution of 1.3 g (2.28 mmol) of 9-[3-(benzyloxycarbonyl-L-phenylalanylamino)-3-deoxy- β -D-arabinofuranosyl)adenine (5) in 100 ml of 95% EtOH was hydrogenated in the presence of 0.3 g of 5% Pd–C for 3 hr at 60° and 1 atm. After standing overnight at ambient temperature, the reaction mixture was filtered through Celite,¹⁸ the Celite washed successively with three 10-ml portions of 95% EtOH, 10 ml of MeOH, and 10 ml of H₂O. The combined filtrate and washes were evapd to afford 0.94 g of product, mp 130–136°. Recrystallization from 115 ml of boiling H₂O and drying at 56° for 15 hr (<1 mm), afforded 0.77 g (78%) of 6 needles, mp 134–137°; $\lambda_{max}^{pH 1}$ 257 m μ (ϵ 16,600); $\lambda_{max}^{pH 7}$ 258 (17,000); $\lambda_{max}^{pH 13}$ 259 (17,700).

Acknowledgment—We are endebted to Mr. Osborne P. Crews, Jr. and his staff for the large scale preparation of intermediates and to Dr. Peter Lim and his staff for the spectra and paper chromatography.
