

57. Hiromu Mori, Kenyu Shibata, Kiyoshi Tsuneda, and Masanobu Sawai :
Synthesis of Ecdysone. I. A Novel Synthesis of
2 β ,3 β -Dihydroxy Steroids.

(Research Laboratory, Teikoku Hormone Mfg. Co., Ltd.*1)

A novel synthesis of 2 β ,3 β -dihydroxy steroids from 3-oxo compounds in 5 α -series was developed. Autoxidation of 3-oxo compound afforded an enol mixture of 2,3-dioxo compound, which on reduction with sodium borohydride yielded 2 β ,3 β -dihydroxy steroid. It was found that 2 β ,3 β -dihydroxy steroid was obtained with high stereospecificity by the reduction of 2-hydroxy-1-en-3-oxo steroid.

(Received May 26, 1966)

An insect hormone, ecdysone, was first isolated by Butenandt and Karlson¹⁾ in 1954 from pupae of silkworm *Bombyx mori*. However, the elucidation of its chemical structure was very difficult problem, not only because only a small amount of material could be isolated from natural sources, but also because it has an unique structure. About one decade later, Huber and Hoppe²⁾ succeeded in the elucidation of the structure by X-ray diffraction analysis, the structure being a highly hydroxylated steroid, 2 β ,3 β ,14 α ,22 β ,25-pentahydroxy-5 β -cholest-7-en-6-one (I). Our program to

Chart 1.

synthesize ecdysone being now in progress, two groups^{3,4)} have reported synthesis of ecdysone independently only one year after the elucidation of the structure. In our schedule, the structure of ecdysone was divided in three partial structures, namely, A-ring structure (II), B,C-ring structure (III) and side chain structure (IV), and synthetic methods of these partial structures were studied indevidedly. Then, the process of synthesis of ecdysone was arranged by combination of methods studied. In our study on 2 β ,3 β -dihydroxy steroids, a novel synthetic method was developed, which will be described in this paper.

All four isomers of 5α -cholestane-2,3-diol have been already prepared and their stereochemical problems have been fully studied.^{5,6)} The preparation of 5α -cholestane-2 β ,3 β -diol was first made by Henbest and Smith⁶⁾ and Shoppee and his co-workers⁵⁾ independently almost at the same time from 5α -cholest-2-ene by treatment with silver acetate, iodine and moist acetic acid. This seemed to be only one method of the synthesis of 2 β ,3 β -dihydroxy steroid for preparative purpose.*² Accordingly, it is very desirable to establish a novel and better synthetic method of 2 β ,3 β -dihydroxy steroid.

2,3-Dioxo steroid was very attractive material for the preparation of 2,3-dihydroxy steroid, because an elegant synthesis of 2,3-dioxo steroid from 3-oxo steroid by autoxidation in the presence of potassium *t*-butoxide in *t*-butanol was developed.⁷⁻⁹⁾ Sodium borohydride reduction of 2,3-dioxo steroids was studied in the hope that 2 β ,3 β -dihydroxy steroids would be obtained, and in fact, it was found that 2 β ,3 β -dihydroxy steroids are major products in these reactions.

The reduction of 2,17 β -dihydroxy-4,4-dimethylandrosta-1,5-dien-3-one (V)⁹⁾ with sodium borohydride in methanol gave an isomer of 2,3-diol in high yield. This diol yielded an acetonide on treatment with acetone in the presence of hydrogen chloride, showing that *cis* diol was obtained. The diol was recovered on the hydrolysis of the acetonide (VII) by hydrochloric acid. Sodium borohydride reduction of 3 β ,17 β -dihydroxy-4,4-dimethylandrosta-5-en-2-one (X) obtainable from V by three steps of reactions (V→

Chart 2.

VIII→IX→X)¹⁰⁾ afforded the diol identical with that obtained above. Consequently, the diol must be formulated as 4,4-dimethylandrosta-5-ene-2 β ,3 β ,17 β -triol (VI).

The success in the preparation of 2 β ,3 β -diol in this special case prompted us further study on reduction of the enol forms of steroidal 2,3-dione. The autoxidation of 5α -cholestan-3-one (XI) by the method developed by Barton and his co-workers afforded the mixture of two possible enol forms of 5α -cholestane-2,3-dione (XII). This mixture was reduced with sodium borohydride in methanol without isolation of enol forms in pure state to give a mixture of 2,3-diols, which was treated with acetone containing hydrogen chloride and chromatographed on Florisil. 5α -Cholestane-2 β ,3 β -diol acetonide (XIV)¹¹⁾ was first eluted, the yield of which was 30~35% based on XI. Two *trans* diols, 5α -cholestane-2 α ,3 β -diol (XVa) and 2 β ,3 α -diol (XVIa) were isolated by further elution of the column as minor products. The structures of these compounds were confirmed by comparison of physical constants of free diols and their acetates with those reported in literature.⁵⁾ It should be noted to describe that the stereochemical course of reduction in enol mixture of 5α -cholestane-2,3-dione (XII) is very different

*² In synthesis of ecdysone in reference 4), it was reported that the reaction of 2 α -bromo-3 β -acetoxy steroid with silver acetate gave 2 β ,3 β -diacetoxy steroid, but detailed experimental data was not given.

from that in V. It was expected that the enol compound (XIX), in which 2-oxo group is enolized, would be reduced to $2\beta,3\beta$ -diol stereospecifically, while the reduction of the other enol compound (XVIII), in which 3-oxo group is enolized, would be not so stereospecific; as a consequence, the reduction of the enol mixture would give $2\beta,3\beta$ -diol with considerable amount of $2\alpha,3\beta$ - and $2\beta,3\alpha$ -diol. In order to ascertain whether this is the case or not, the stereochemical course of reduction in two pure diosphenols, XVIII and XIX was investigated.

Chart 3.

acetone and *trans*-diol fraction were separated by chromatography on Florisil. After hydrolysis of *cis*-diol acetonide fractions, *cis*- and *trans*-diol fractions were submitted to gas chromatography as trimethyl silyl ether, and fully separated chromatograms were obtained (Fig. 1-B, 1-C, 2-B and 2-C). Although 5α -cholestane- $2\alpha,3\alpha$ -diol could not be isolated in large scale experiment on the reduction of enol mixture, it is apparently detected in Fig. 1-C. It should be noted that $2\alpha,3\alpha$ -diol was produced only in reduction of the diosphenol (XVIII). The ratios of diols in reduction products were calculated as shown in Table I. From these observations it is concluded that the

From the enol mixture of 5α -cholestane-2,3-dione described above, the pure diosphenols (XVIII and XIX) were isolated by the procedure reported by Stiller and Rosenhelm.¹²⁾ These two diosphenols were reduced and the reduction products were submitted to gas chromatography as trimethyl silyl ether. As shown in Fig. 1-A and 2-A, two peaks were observed in their chromatogram. $2\alpha,3\beta$ -Diol and $2\beta,3\beta$ -diol should be considered not to be separated in Fig. 1-A and 2-A, because trimethyl silyl ether of 5α -cholestane- $2\alpha,3\beta$ -diol, $2\beta,3\alpha$ -diol and $2\beta,3\beta$ -diol were found to show retention times of 3.85, 2.64 and 3.70 (5α -cholestane = 1.00) respectively. In order to obtain clearly separated chromatograms, the reduction products were treated with acetone containing hydrogen chloride, and *cis*-diol

TABLE I. Ratio of Reduction Product in Diosphenols (XVIII and XIX)

Compound reduced	Ratio of reduction product (%) ^{a)}			
	$2\beta,3\alpha$	$2\alpha,3\alpha$	$2\beta,3\beta$	$2\alpha,3\beta$
XVIII	22	20	38	20
XIX	6	0	89	5

a) These values are calculated from weights of *cis*- and *trans*-diol fractions and data from chromatogram shown in Fig. 1-B, 1-C, 2-B and 2-C.

12) E. T. Stiller, O. Rosenhelm : J. Chem. Soc., 1938, 353.

ratios of products are very different; $2\beta,3\alpha : 2\alpha,3\alpha : 2\beta,3\beta : 2\alpha,3\beta \rightleftharpoons 1:1:2:1$ (from 3-enol compound (XVIII)), $2\beta,3\alpha : 2\beta,3\beta : 2\alpha,3\beta \rightleftharpoons 1:19:1$ (from 2-enol compound (XIX)). This result clearly supports the concept described above.

Fig. 1. Gas Chromatogram of Reduction Product from XVIII

Fig. 2. Gas Chromatogram of Reduction Product from XIX

TABLE II. Difference of Frequencies between Free and Hydrogen-bonded OH Absorption

Compound	Conformation	$\Delta\nu$ (cm ⁻¹)	L (Å)	ϕ (°C)
$2\beta,3\beta$ -diol (XVIIa)	a,e- <i>cis</i>	45	2.10	41
$2\alpha,3\beta$ -diol (XVa)	e,e- <i>trans</i>	31	2.38	60

Infrared spectra were measured in concentration of 1/300M/L. in CCl₄ by 3 mm. NaCl cell. (Prism: NaCl)

The difference in ratios of diols between these diosphenols can be explained reasonably as follows. The first reduction by sodium borohydride should be considered to be taken place at the non-enolized carbonyl group. It was known that 3-oxo steroids in 5 α -series are reduced by metal hydride to 3 β -hydroxy compounds with high stereospecificity.¹³⁾ Thus, stereospecific reduction to 3 β -hydroxy compound in the diosphenol (XIX) is expected. The ketol (3 β -hydroxy-2-one) thus obtained was reduced again to $2\beta,3\beta$ -diol in high yield, because 3 β -hydroxy group probably disturbs β -side attack of the reagent at the carbonyl group. On the other hand, the metal hydride reduction of 2-oxo steroids in 5 α -series are not so stereospecific as that of 3-oxo steroids. Accordingly, the diosphenol (XVIII) must be considered to be reduced at first stage ketol mixture (2-hydroxy-3-ones) without high stereospecificity. As a result, such a stereospecificity in another diosphenol (XIX) would not be observed in this case.

Infrared absorption spectra of 5 α -cholestane- $2\alpha,3\beta$ -diol (XVa), $2\beta,3\alpha$ -diol (XVIa) and $2\beta,3\beta$ -diol (XVIIa) in OH stretching region were measured. Intramolecular hydrogen-bonding was observed in $2\alpha,3\beta$ -diol (XVa) and $2\beta,3\beta$ -diol (XVIIa), while not in $2\beta,3\alpha$ -diol

13) L. F. Fieser, M. Fieser: "Steroids," p. 268. Reinhold Publishing Co., N. Y. (1959).

(XVIa). It is quite reasonable that axial-axial *trans*-diol is not intramolecular hydrogen-bonded. The difference of frequencies between free and hydrogen-bonded hydroxy absorption ($\Delta\nu$) in XVa and XVIIa are shown in Table II. Kuhn¹⁴) has reported an empirical relationship between $\Delta\nu$ and hydrogen-bonded distance (L) as follows.

$$\Delta\nu = \frac{250}{L} - 74$$

L values in XVa and XVIIa are calculated as 2.38 Å and 2.10 Å by applying this equation, showing that dihedral angles of oxygen atoms at C-2 and C-3 are 60° and 41°. Kuhn¹⁴) has described that $\Delta\nu$ value of *trans*- and *cis*-cyclohexane-1,2-diol are 33 cm⁻¹ and 38 cm⁻¹. In the case of XVa, the value listed in Table II is consistent with that of *trans*-cyclohexane-1,2-diol within error. On the other hand, $\Delta\nu$ value of 2 β ,3 β -diol (XVIIa) is considerably large comparing with that of *cis*-cyclohexane-1,2-diol. It should be considered that 2 β -hydroxy group in XVIIa is deformed so as to diminish the dihedral angle due to 1,3-diaxial interaction with 19-methyl group.

Experimental*3

4,4-Dimethylandrosta-5-ene-2 β ,3 β ,17 β -triol (VI)—a) From V: To a solution of 2,17 β -dihydroxy-4,4-dimethylandrosta-1,5-dien-3-one (V, 5.0 g.) in MeOH (100 ml.) was added NaBH₄ (2.5 g.) and the solution was refluxed for 1 hr. After decomposition of excess NaBH₄ by addition of AcOH, H₂O was added and precipitates were collected by filtration, washed with H₂O, and dried. Recrystallization from MeOH afforded the triol (VI, 4.55 g.), m.p. 267~271°. An analytical sample was obtained by further recrystallization from the same solvent as colorless needles. m.p. 268~270°, $[\alpha]_D^{25}$ -53° (c=0.98, dioxane). *Anal.* Calcd. for C₂₁H₃₄O₃: C, 75.40; H, 10.25. Found: C, 75.23; H, 10.34.

b) From VII: A solution of 4,4-dimethylandrosta-5-ene-2 β ,3 β ,17 β -triol 2,3-acetonide (VII, 50 mg.) in dioxane (3.5 ml.) and 2% HCl (3.5 ml.) was refluxed for 2.5 hr., and poured into H₂O. The product was extracted with ether and after washing with H₂O and drying (Na₂SO₄), the solvent was removed by distillation. The residue was recrystallized from MeOH to give the triol (VI), the infrared spectrum of which was identical with that of the compound obtained above.

c) From X: 3 β ,17 β -Dihydroxy-4,4-dimethylandrosta-5-en-3-one (X, 100 mg.) was reduced with NaBH₄ (10 mg.) in MeOH (100 ml.), and usual treatment of isolation yielded the triol (VI) identical with the compound obtained above.

4,4-Dimethylandrosta-5-ene-2 β ,3 β ,17 β -triol 2,3-Acetonide (VII)—4,4-Dimethylandrosta-5-ene-2 β ,3 β ,17 β -triol (VI, 1.0 g.) was suspended in acetone (25 ml.) and saturated HCl solution in acetone (25 ml.) was added. After standing overnight at room temperature, the solution was poured into 5% Na₂CO₃, and the product was extracted with ether. After washing with H₂O and drying (Na₂SO₄), the solvent was removed by distillation. The residue was recrystallized from acetone to give the acetonide (VII, 0.957 g.), m.p. 179~181°. An analytical sample was obtained by further recrystallization from the same solvent as colorless prisms. m.p. 179~181°, $[\alpha]_D^{25}$ -48° (c=0.86). *Anal.* Calcd. for C₂₄H₃₈O₃: C, 76.96; H, 10.23. Found: C, 77.38; H, 10.36.

Reduction of Enol Mixture of 5 α -Cholestane-2,3-dione (XII)—5 α -Cholestan-3-one (XI, 7.0 g.) was added to *t*-BuOH (280 ml.) in which K (8.4 g.) was dissolved beforehand, and the suspension was stirred under oxygen atmosphere at 19°, for 30 min., during which 470 ml. of oxygen was absorbed. The resulting solution was poured into H₂O, and acidified with 10% HCl. The product was extracted with ether and the ether solution was shaken with 40% KOH. The ether layer was removed by decantation and the precipitated K salt was suspended in ice-cold H₂O. After acidification with 10% HCl, the free diosphenol was extracted with ether, and the ether layer was washed with 5% Na₂CO₃ and H₂O, and dried (Na₂SO₄). Ether was removed by distillation to afford white solid (XIII).

The suspension of the solid obtained above in MeOH (280 ml.) and NaBH₄ (3.5 g.) was stirred at 5° for 30 min., and the resulting solution was refluxed for 2 hr. After decomposition of excess NaBH₄ by addition of AcOH, H₂O was added and the product was extracted with ether. The ether solution was washed with H₂O and dried (Na₂SO₄). Ether was removed by distillation to give a mixture of 5 α -cholestane-2,3-diols (XIII) as white solid.

*3 All melting points were uncorrected, and optical rotations were measured in chloroform unless otherwise described.

14) L. P. Kuhn: J. Am. Chem. Soc., **74**, 2492 (1952); **76**, 4323 (1954).

The suspension of the mixture (XIII) in acetone (175 ml.) and acetone (175 ml.) saturated with HCl was allowed to stand overnight at room temperature. The solid in the suspension was collected by filtration and recrystallized from MeOH to give 5 α -cholestane-2 α ,3 β -diol (XVa, 287 mg.), m.p. 204~208°. The filtrate was poured into ice-cold 5% Na₂CO₃ and the product was extracted with ether. After washing with H₂O and drying (Na₂SO₄), the solvent was evaporated to dryness. The residue was chromatographed on Florisil (140 g.). Recrystallization of the material eluted by *n*-hexane-EtOAc (9:1) afforded 5 α -cholestane-2 β ,3 β -diol acetonide (XIV, 2.34 g.), m.p. 110~113°, $[\alpha]_D^{25} + 47^\circ$ ($c=1.01$) (reported,¹¹) m.p. 117°, $[\alpha]_D + 40^\circ$). The material eluted earlier with *n*-hexane-EtOAc (1:1) was recrystallized from MeOH to yield 5 α -cholestane-2 β ,3 α -diol (XVIa, 203 mg.), m.p. 202~206°, $[\alpha]_D^{25} + 34^\circ$ ($c=1.05$) (reported,⁵) m.p. 200~202°, $[\alpha]_D + 33^\circ$). The material obtained by further elution with the same solvent was acetylated with Ac₂O-pyridine at room temperature, and 5 α -cholestane-2 β ,3 α -diol diacetate (XVIIb, 296 mg.), m.p. 133~135°, $[\alpha]_D^{25} + 57^\circ$ ($c=1.13$) (reported,⁵) m.p. 133~135°, $[\alpha]_D + 56^\circ$) was obtained three times recrystallization from acetone-MeOH. The substance eluted with *n*-hexane-EtOAc (1:4) and EtOAc was recrystallized from MeOH to give 5 α -cholestane-2 α ,3 β -diol (XVa, 174 mg.), m.p. 210~212°, $[\alpha]_D^{25} + 16^\circ$ ($c=1.14$) (reported,⁵) m.p. 204~205°, $[\alpha]_D + 17^\circ$).

5 α -Cholestane-2 β ,3 β -diol (XVIIa)—A solution of 5 α -cholestane-2 β ,3 β -diol acetonide (XIV, 1.0 g.) in dioxane (70 ml.) and 2% HCl (70 ml.) was refluxed for 4 hr., and poured into H₂O. The product was extracted with ether and after washing with 5% Na₂CO₃ and H₂O, and drying (Na₂SO₄), the solvent was evaporated to dryness. The residue was recrystallized from MeOH to give the diol (XVIIa, 0.7 g.), m.p. 170~174°, $[\alpha]_D^{25} + 40^\circ$ ($c=1.00$) (reported,⁵) m.p. 176~177°, $[\alpha]_D + 38^\circ$).

5 α -Cholestane-2 β ,3 β -diol Diacetate (XVIIb)—A solution of 5 α -cholestane-2 β ,3 β -diol (XVIIa, 0.2 g.) in Ac₂O (5.0 ml.) was refluxed for 2 hr., and poured into H₂O. The product was extracted with ether and the ether layer was washed with 5% Na₂CO₃ and H₂O, and dried (Na₂SO₄). After removal of the solvent, the residue was recrystallized from acetone-MeOH to give the acetate (XVIIb, 0.19 g.), m.p. 118~119°, $[\alpha]_D^{25} + 37^\circ$ ($c=0.98$) (reported,⁵) m.p. 119°, $[\alpha]_D + 38^\circ$).

5 α -Cholestane-2 α ,3 β -diol Diacetate (XVb)—5 α -Cholestane-2 α ,3 β -diol (XVa, 100 mg.) was acetylated by Ac₂O (4.0 ml.) and pyridine (4.0 ml.) at room temperature. The diacetate (XVb, 89 mg.), m.p. 108~110°, $[\alpha]_D^{25} - 30^\circ$ ($c=1.03$) (reported,⁵) m.p. 106~107°, $[\alpha]_D - 27^\circ$) was obtained.

2-Hydroxy-5 α -cholest-1-en-3-one (XIX) and 3-Hydroxy-5 α -cholest-3-en-2-one (XVIII)—From the enol mixture obtained by autoxidation of 5 α -cholestane-3-one as the procedure described above, the separation of pure diosphenols (XVIII and XIX) was carried out by the procedure reported by Stiller and Rosenheim.¹²

Reduction of 2-Hydroxy-5 α -cholest-1-en-3-one (XIX)—A mixture of XIX (101.8 mg.) and NaBH₄ (100 mg.) in MeOH (30 ml.) was stirred at 0° for 30 min., and then refluxed for 3 min. After cooling, AcOH (5 drops) was added and the mixture was stirred for 1 hr. The solution was poured into H₂O, and the product was extracted with ether. After washing with 5% Na₂CO₃ and H₂O, and drying (Na₂SO₄), the solvent was removed by distillation to give crystalline solid (Fig. 2-A, 100.5 mg.).

To a suspension of the solid (Fig. 2-A, 118 mg.) in acetone (20 ml.) was added 5% phosphomolybdic acid in acetone (2.4 ml.). After standing at room temperature for 15 min, the mixture was poured into 5% NH₄OH. The product was extracted with ether, and after washing with 5% Na₂CO₃ and H₂O, and drying (Na₂SO₄), the solvent was removed by distillation. The residue was chromatographed on Florisil (4.0 g.). Acetonide fraction (100.0 mg.) was eluted with *n*-hexane-EtOAc (9:1), and *trans*-diol fraction (Fig. 2-B, 12.6 mg.) was obtained by elution with EtOAc.

A mixture of the acetonide fraction in EtOH (15 ml.) and 10% H₃PO₄ (2.4 ml.) was refluxed for 30 min., and poured into H₂O. The product was extracted with ether, and after washing with 5% Na₂CO₃ and H₂O, and drying (Na₂SO₄), the solvent was removed by distillation to give *cis*-diol fraction (Fig. 2-C, 94.9 mg.).

Fig. 2-A, 2-B and 2-C were transformed into trimethyl silyl ether by usual manner respectively, and submitted to gas chromatography.

Reduction of 3-Hydroxy-5 α -cholest-3-en-2-one (XVIII)—XVIII (100.4 mg.) was reduced by the same procedure described above to give crystalline solid (Fig. 1-A, 98.0 mg.). The separation of *trans*-diol (Fig. 1-B, 36.1 mg.) and *cis*-diol (Fig. 1-C, 50.0 mg.) fraction was carried out as described above. Fig. 1-A, 1-B and 1-C were submitted to gas chromatography as trimethyl silyl ether.

Gas chromatography was carried out on Shimadzu GC-B1. Column: 1% SE-52 on Chromsorb W, 4 mm. 2.25 m. Carrier gas: N₂ 40 ml./min. Column temperature: 236.5°.

The authors are indebted to Prof. M. Shiota (Ochanomizu University) and Prof. U. Mizuhara (Keio University) for their interest and discussion, and also Drs. I. Chuman, H. Ando and S. Wada (this company) for their support and encouragement throughout this work.
