STERIODS. CXXXII.¹ 2-FLUORO AND 21,21-DIFLUORO STEROIDS

Sir:

The fluorination of active methylene compounds with perchloryl fluoride has been demonstrated recently.² Subsequently, Gabbard and Jensen³ utilized this reagent in the steroid series, preparing 2 α -fluorocholestanone from cholestanone pyrrolidyl enamine while Kissman, Small and Weiss⁴ prepared 2 α -fluorohydrocortisone from 2-methoxalyhydrocortisone 20-ketal.

We have prepared a number of 2 α -fluoro steroids in the potentially important androstane series by reaction of the sodio salt of the appropriate 2-hydroxymethylene-3-keto steroid with perchloryl fluoride followed by alkaline cleavage of the resultant 2-aldehydo-2-fluoro compounds.⁵ Thus, 2-hydroxymethylene-testosterone,⁶ -androstan-17 β -ol-3-one (m.p. 125–130°, [α]_D + 60° (all rot. in CHCl₃), $\lambda_{\text{max}}^{\text{EtOH}}$ 282 m μ , log ϵ 3.94), -17 α -methyltestosterone,⁷ and 2-hydroxymethylene-17 α -methylandrostan-17 β -ol-3-one,⁷ in benzene solution, were reacted successively with sodium methoxide and perchloryl fluoride. Treatment of the reaction products with potassium acetate in boiling methanol gave 2 α -fluorotestosterone (I) (m.p. 140–141°, [α]_D + 131°, $\lambda_{\text{max}}^{\text{EtOH}}$ 242 m μ , log ϵ 4.15, $\lambda_{\text{max}}^{\text{KBr}}$ 5.90 μ . Found for C₁₉H₂₇FO₂: C, 74.27; H, 8.85; F, 5.97); 2 α -fluoroandrostan-17 β -ol-3-one⁸ (II) (m.p. 183–185°, [α]_D + 63°, $\lambda_{\text{max}}^{\text{EtOH}}$ 283 m μ , log ϵ 1.44, $\lambda_{\text{max}}^{\text{KBr}}$ 5.75 μ . Found for C₂₁H₃₁FO₂·C₃H₆O: C, 70.96; H, 8.91; F, 4.81); II acetate (m.p. 190–193°, [α]_D + 56°); 2 α -fluoro-17 α -methyltestosterone (III) (m.p. 168–169°, [α]_D + 116°, $\lambda_{\text{max}}^{\text{EtOH}}$ 242 m μ , log ϵ 4.22, $\lambda_{\text{max}}^{\text{KBr}}$ 5.90 μ . Found for C₂₀H₂₉FO₂: C, 75.30; H, 8.63; F, 5.80); 2 α -fluoro-17 α -methylandrostan-17 β -ol-3-one (IV) (m.p. 193–194°, [α]_D + 46°, $\lambda_{\text{max}}^{\text{EtOH}}$ 283 m μ , log ϵ 1.52, $\lambda_{\text{max}}^{\text{KBr}}$ 5.75 μ . Found for C₂₀H₃₁FO₂: C, 74.49; H, 9.69; F, 5.89). The assignment of the 2 α -fluoro configuration rests on the shift in the infrared and lack of shift in the ultra-

violet of the carbonyl maximum⁹ as well as on rotatory dispersion data.¹⁰

2 α -Fluoro-17 α -ethynyltestosterone (V) (m.p. 243–245°, [α]_D + 65°, $\lambda_{\text{max}}^{\text{KBr}}$ 242 m μ , log ϵ 4.28, $\lambda_{\text{max}}^{\text{KBr}}$ 3.00, 5.90 μ . Found for C₂₁H₂₇FO₂: C, 76.47; H, 8.28; F, 5.39) was prepared by condensing 17 α -ethynyltestosterone with ethyl formate and treating the crude 2-hydroxymethylene compound as described above.

Since sodio malonic ester is difluorinated by perchloryl fluoride even in the absence of excess base² it appeared that 21,21-difluorination, leading to a hitherto unknown class of steroids, would be feasible. The sodio salt of 21-ethoxalyl- Δ^5 -pregnen-3 β -ol-20-one¹¹ in absolute ethanol or benzene and in the presence of excess sodium methoxide was treated with perchloryl fluoride and then methanolic potassium acetate yielding 21,21-difluoro- Δ^5 -pregnen-3 β -ol-20-one (m.p. 133–135°, [α]_D + 54°, $\lambda_{\text{max}}^{\text{KBr}}$ 5.75 μ . Found for C₂₁H₃₀F₂O₂: C, 71.05; H, 8.88; F, 10.28). Oppenauer oxidation gave 21,21-difluoroprogestosterone (VI) (m.p. 140–143°, [α]_D + 204°, $\lambda_{\text{max}}^{\text{EtOH}}$ 241 m μ , log ϵ 4.22, $\lambda_{\text{max}}^{\text{KBr}}$ 5.75, 6.00 μ . Found for C₂₁H₂₈F₂O₂: C, 72.54; H, 8.10; F, 10.14).

In preliminary seven day assays¹² in the castrate rat, I and II exhibited 20% and 50% of the androgenic potency of testosterone with myotrophic activity about 50% of the standard while compound III, orally administered in the same assay was 25% as androgenic as methyltestosterone. Both I and II were potent gonadotrophin inhibitors in a 10-day parabiotic rat assay.¹² VI was considerably less active than progesterone in the Claiberg assay¹² in sharp contrast to the activity of 21-monofluoroprogestosterone.¹³

ISOTOPE SEPARATION BY ION EXCHANGE

Sir:

The sign, magnitude and trend of the separation factors observed by Lee and Begun¹ provide another example of the close analogy between ion exchange resins and concentrated aqueous solution, because the observed values are very nearly those which would be expected from an equilibrium between a dilute aqueous solution and a concentrated aqueous solution of a molality corresponding to that of the exchangers concerned.

For two aqueous solutions, e.g., of LiCl, the separation factor $k = 1 + \epsilon$ is given by the ratio of
